Continuity and Differentiability

Short Answer Type Questions

Q. 1 Examine the continuity of the function $f(x) = x^3 + 2x^2 - 1$ at $x = 1$.

Thinking Process

We know that, function f will be continuous at $x = a$, if $\lim_{x \rightarrow a^-} f(x) = \lim_{x \rightarrow a^+} f(x) = f(a)$.

Sol. We have,

$$f(x) = x^3 + 2x^2 - 1 \text{ at } x = 1.$$

∴

$$\lim_{x \rightarrow 1^+} f(x) = \lim_{h \rightarrow 0} (1+h)^3 + 2(1+h)^2 - 1 = 2$$

and

$$\lim_{x \rightarrow 1^-} f(x) = \lim_{h \rightarrow 0} (1-h)^3 + 2(1-h)^2 - 1 = 2$$

∴

$$\lim_{x \rightarrow 1^+} f(x) = \lim_{x \rightarrow 1^-} f(x)$$

and

$$f(1) = 1 + 2 - 1 = 2$$

So, $f(x)$ is continuous at $x = 1$.

Note Every polynomial function is continuous at any real point.

Q. 2 $f(x) = \begin{cases} 3x + 5, & \text{if } x \geq 2 \\ x^2, & \text{if } x < 2 \end{cases}$ at $x = 2$.

Sol. We have,

$$f(x) = \begin{cases} 3x + 5, & \text{if } x \geq 2 \\ x^2, & \text{if } x < 2 \end{cases} \text{ at } x = 2.$$

At $x = 2$,

$$\begin{aligned} \text{LHL} &= \lim_{x \rightarrow 2^-} (x)^2 \\ &= \lim_{h \rightarrow 0} (2-h)^2 = \lim_{h \rightarrow 0} (4+h^2 - 4h) = 4 \end{aligned}$$

and

$$\begin{aligned} \text{RHL} &= \lim_{x \rightarrow 2^+} (3x + 5) \\ &= \lim_{h \rightarrow 0} [3(2+h) + 5] = 11 \end{aligned}$$

Since,

$$\text{LHL} \neq \text{RHL} \text{ at } x = 2$$

So, $f(x)$ is discontinuous at $x = 2$.

$$\text{Q. 3 } f(x) = \begin{cases} \frac{1 - \cos 2x}{x^2}, & \text{if } x \neq 0 \\ 5, & \text{if } x = 0 \end{cases} \text{ at } x = 0.$$

Sol. We have,

$$f(x) = \begin{cases} \frac{1 - \cos 2x}{x^2}, & \text{if } x \neq 0 \\ 5, & \text{if } x = 0 \end{cases} \text{ at } x = 0.$$

At $x = 0$,

$$\begin{aligned} \text{LHL} &= \lim_{x \rightarrow 0^-} \frac{1 - \cos 2x}{x^2} \\ &= \lim_{h \rightarrow 0} \frac{1 - \cos 2(0 - h)}{(0 - h)^2} \\ &= \lim_{h \rightarrow 0} \frac{1 - \cos 2h}{h^2} && [\because \cos(-\theta) = \cos \theta] \\ &= \lim_{h \rightarrow 0} \frac{1 - 1 + 2 \sin^2 h}{h^2} && [\because \cos 2\theta = 1 - 2\sin^2 \theta] \\ &= \lim_{h \rightarrow 0} \frac{2(\sin h)^2}{(h)^2} \\ &= 2 \\ \text{RHL} &= \lim_{x \rightarrow 0^+} \frac{1 - \cos 2x}{x^2} \\ &= \lim_{h \rightarrow 0} \frac{1 - \cos 2(0 + h)}{(0 + h)^2} \\ &= \lim_{h \rightarrow 0} \frac{2 \sin^2 h}{h^2} = 2 && \left[\because \lim_{h \rightarrow 0} \frac{\sin h}{h} = 1 \right] \end{aligned}$$

and

$$f(0) = 5$$

Since,

$$\text{LHL} = \text{RHL} \neq f(0)$$

Hence, $f(x)$ is not continuous at $x = 0$.

$$\text{Q. 4 } f(x) = \begin{cases} \frac{2x^2 - 3x - 2}{x - 2}, & \text{if } x \neq 2 \\ 5, & \text{if } x = 2 \end{cases} \text{ at } x = 2.$$

$$\text{Sol. We have, } f(x) = \begin{cases} \frac{2x^2 - 3x - 2}{x - 2}, & \text{if } x \neq 2 \\ 5, & \text{if } x = 2 \end{cases} \text{ at } x = 2.$$

At $x = 2$,

$$\begin{aligned} \text{LHL} &= \lim_{x \rightarrow 2^-} \frac{2x^2 - 3x - 2}{x - 2} \\ &= \lim_{h \rightarrow 0} \frac{2(2 - h)^2 - 3(2 - h) - 2}{(2 - h) - 2} \\ &= \lim_{h \rightarrow 0} \frac{8 + 2h^2 - 8h - 6 + 3h - 2}{-h} \\ &= \lim_{h \rightarrow 0} \frac{2h^2 - 5h}{-h} = \lim_{h \rightarrow 0} \frac{h(2h - 5)}{-h} = 5 \end{aligned}$$

$$\text{RHL} = \lim_{x \rightarrow 2^+} \frac{2x^2 - 3x - 2}{x - 2}$$

$$\begin{aligned}
&= \lim_{h \rightarrow 0} \frac{2(2+h)^2 - 3(2+h) - 2}{(2+h) - 2} \\
&= \lim_{h \rightarrow 0} \frac{8+2h^2 + 8h - 6 - 3h - 2}{h} \\
&= \lim_{h \rightarrow 0} \frac{2h^2 + 5h}{h} = \lim_{h \rightarrow 0} \frac{h(2h+5)}{h} = 5
\end{aligned}$$

and

$$f(2) = 5$$

$$\therefore \text{LHL} = \text{RHL} = f(2)$$

So, $f(x)$ is continuous at $x = 2$.

Q. 5 $f(x) = \begin{cases} \frac{|x-4|}{2(x-4)}, & \text{if } x \neq 4 \\ 0, & \text{if } x = 4 \end{cases}$ at $x = 4$.

Sol. We have,

$$f(x) = \begin{cases} \frac{|x-4|}{2(x-4)}, & \text{if } x \neq 4 \\ 0, & \text{if } x = 4 \end{cases}$$

At $x = 4$,

$$\begin{aligned}
\text{LHL} &= \lim_{x \rightarrow 4^-} \frac{|x-4|}{2(x-4)} \\
&= \lim_{h \rightarrow 0} \frac{|4-h-4|}{2[(4-h)-4]} = \lim_{h \rightarrow 0} \frac{|0-h|}{(8-2h-8)} \\
&= \lim_{h \rightarrow 0} \frac{h}{-2h} = \frac{-1}{2} \quad \text{and} \quad f(4) = 0 \neq \text{LHL}
\end{aligned}$$

So, $f(x)$ is discontinuous at $x = 4$.

Q. 6 $f(x) = \begin{cases} |x| \cos \frac{1}{x}, & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases}$ at $x = 0$.

Sol. We have,

$$f(x) = \begin{cases} |x| \cos \frac{1}{x}, & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases}$$

At $x = 0$,

$$\begin{aligned}
\text{LHL} &= \lim_{x \rightarrow 0^-} |x| \cos \frac{1}{x} = \lim_{h \rightarrow 0} |0-h| \cos \frac{1}{0-h} \\
&= \lim_{h \rightarrow 0} h \cos \left(\frac{-1}{h} \right) \\
&= 0 \times [\text{an oscillating number between } -1 \text{ and } 1] = 0
\end{aligned}$$

$$\begin{aligned}
\text{RHL} &= \lim_{x \rightarrow 0^+} |x| \cos \frac{1}{x} \\
&= \lim_{h \rightarrow 0} |0+h| \cos \frac{1}{(0+h)} \\
&= \lim_{h \rightarrow 0} h \cos \frac{1}{h} \\
&= 0 \times [\text{an oscillating number between } -1 \text{ and } 1] = 0
\end{aligned}$$

and

$$f(0) = 0$$

Since,

$$\text{LHL} = \text{RHL} = f(0)$$

So, $f(x)$ is continuous at $x = 0$.

$$\text{Q. 7 } f(x) = \begin{cases} |x-a| \sin \frac{1}{x-a}, & \text{if } x \neq a \\ 0, & \text{if } x = a \end{cases} \quad \text{at } x = a.$$

Sol. We have,

$$f(x) = \begin{cases} |x-a| \sin \frac{1}{x-a}, & \text{if } x \neq a \\ 0, & \text{if } x = a \end{cases} \quad \text{at } x = a$$

$$\begin{aligned} \text{At } x = a, \quad \text{LHL} &= \lim_{x \rightarrow a^-} |x-a| \sin \frac{1}{x-a} \\ &= \lim_{h \rightarrow 0} |a-h-a| \sin \left(\frac{1}{a-h-a} \right) \\ &= \lim_{h \rightarrow 0} -h \sin \left(\frac{1}{h} \right) \quad [\because \sin(-\theta) = -\sin \theta] \\ &= 0 \times [\text{an oscillating number between } -1 \text{ and } 1] = 0 \\ \text{RHL} &= \lim_{x \rightarrow a^+} |x-a| \sin \left(\frac{1}{x-a} \right) \\ &= \lim_{h \rightarrow 0} |a+h-a| \sin \left(\frac{1}{a+h-a} \right) = \lim_{h \rightarrow 0} h \sin \frac{1}{h} \\ &= 0 \times [\text{an oscillating number between } -1 \text{ and } 1] = 0 \end{aligned}$$

and

$$f(a) = 0$$

$$\therefore \text{LHL} = \text{RHL} = f(a)$$

So, $f(x)$ is continuous at $x = a$.

$$\text{Q. 8 } f(x) = \begin{cases} \frac{e^{1/x}}{1+e^{1/x}}, & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases} \quad \text{at } x = 0.$$

Sol. We have,

$$f(x) = \begin{cases} \frac{e^{1/x}}{1+e^{1/x}}, & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases} \quad \text{at } x = 0$$

$$\begin{aligned} \text{At } x = 0, \quad \text{LHL} &= \lim_{x \rightarrow 0^-} \frac{e^{1/x}}{1+e^{1/x}} = \lim_{h \rightarrow 0} \frac{e^{1/0-h}}{1+e^{1/0-h}} \\ &= \lim_{h \rightarrow 0} \frac{e^{-1/h}}{1+e^{-1/h}} = \lim_{h \rightarrow 0} \frac{1}{e^{1/h}(1+e^{-1/h})} \\ &= \lim_{h \rightarrow 0} \frac{1}{e^{1/h}+1} = \frac{1}{e^\infty+1} = \frac{1}{\infty+1} \quad [\because e^\infty = \infty] \\ &= \frac{\frac{1}{1}}{0} = 0 \\ \text{RHL} &= \lim_{x \rightarrow 0^+} \frac{e^{1/x}}{1+e^{1/x}} \\ &= \lim_{h \rightarrow 0} \frac{e^{1/0+h}}{1+e^{1/0+h}} = \lim_{h \rightarrow 0} \frac{e^{1/h}}{1+e^{1/h}} \end{aligned}$$

$$\begin{aligned}
&= \lim_{h \rightarrow 0} \frac{1}{e^{-1/h} + 1} = \frac{1}{e^{-\infty} + 1} \\
&= \frac{1}{0+1} = 1 \quad [: e^{-\infty} = 0]
\end{aligned}$$

Hence, LHL \neq RHL at $x = 0$.

So, $f(x)$ is discontinuous at $x = 0$.

Q. 9 $f(x) = \begin{cases} \frac{x^2}{2}, & \text{if } 0 \leq x \leq 1 \\ 2x^2 - 3x + \frac{3}{2}, & \text{if } 1 < x \leq 2 \end{cases}$ at $x = 1$.

Sol. We have, $f(x) = \begin{cases} \frac{x^2}{2}, & \text{if } 0 \leq x \leq 1 \\ 2x^2 - 3x + \frac{3}{2}, & \text{if } 1 < x \leq 2 \end{cases}$ at $x = 1$

At $x = 1$,

$$\begin{aligned}
\text{HL} &= \lim_{x \rightarrow 1^-} \frac{x^2}{2} = \lim_{h \rightarrow 0} \frac{(1-h)^2}{2} \\
&= \lim_{h \rightarrow 0} \frac{1+h^2-2h}{2} = \frac{1}{2} \\
\text{RHL} &= \lim_{x \rightarrow 1^+} \left(2x^2 - 3x + \frac{3}{2} \right) \\
&= \lim_{h \rightarrow 0} \left[2(1+h)^2 - 3(1+h) + \frac{3}{2} \right] \\
&= \lim_{h \rightarrow 0} \left(2+2h^2+4h-3-3h+\frac{3}{2} \right) = -1 + \frac{3}{2} = \frac{1}{2}
\end{aligned}$$

and

$$f(1) = \frac{1^2}{2} = \frac{1}{2}$$

$$\therefore \text{LHL} = \text{RHL} = f(1)$$

Hence, $f(x)$ is continuous at $x = 1$.

Q. 10 $f(x) = |x| + |x - 1|$ at $x = 1$.

Sol. We have, $f(x) = |x| + |x - 1|$ at $x = 1$

At $x = 1$,

$$\begin{aligned}
\text{LHL} &= \lim_{x \rightarrow 1^-} [|x| + |x - 1|] \\
&= \lim_{h \rightarrow 0} [|1-h| + |1-h-1|] = 1 + 0 = 1
\end{aligned}$$

and

$$\begin{aligned}
\text{RHL} &= \lim_{x \rightarrow 1^+} [|x| + |x - 1|] \\
&= \lim_{h \rightarrow 0} [|1+h| + |1+h-1|] = 1 + 0 = 1
\end{aligned}$$

and

$$f(1) = |1| + |0| = 1$$

$$\therefore \text{LHL} = \text{RHL} = f(1)$$

Hence, $f(x)$ is continuous at $x = 1$.

Note Every modulus function is a continuous function at any real point.

$$\text{Q. 11 } f(x) = \begin{cases} 3x - 8, & \text{if } x \leq 5 \\ 2k, & \text{if } x > 5 \end{cases} \text{ at } x = 5.$$

$$\text{Sol. We have, } f(x) = \begin{cases} 3x - 8, & \text{if } x \leq 5 \\ 2k, & \text{if } x > 5 \end{cases} \text{ at } x = 5$$

Since, $f(x)$ is continuous at $x = 5$.

$$\therefore \text{LHL} = \text{RHL} = f(5)$$

$$\begin{aligned} \text{Now, LHL} &= \lim_{x \rightarrow 5^-} (3x - 8) = \lim_{h \rightarrow 0} [3(5 - h) - 8] \\ &= \lim_{h \rightarrow 0} [15 - 3h - 8] = 7 \end{aligned}$$

$$\text{RHL} = \lim_{x \rightarrow 5^+} 2k = \lim_{h \rightarrow 0} 2k = 2k = 7 \quad [\because \text{LHL} = \text{RHL}]$$

and

$$f(5) = 3 \times 5 - 8 = 7$$

$$\therefore 2k = 7 \Rightarrow k = \frac{7}{2}$$

$$\text{Q. 12 } f(x) = \begin{cases} \frac{2^{x+2} - 16}{4^x - 16}, & \text{if } x \neq 2 \\ k, & \text{if } x = 2 \end{cases} \text{ at } x = 2.$$

$$\text{Sol. We have, } f(x) = \begin{cases} \frac{2^{x+2} - 16}{4^x - 16}, & \text{if } x \neq 2 \\ k, & \text{if } x = 2 \end{cases} \text{ at } x = 2$$

Since, $f(x)$ is continuous at $x = 2$.

$$\therefore \text{LHL} = \text{RHL} = f(2)$$

$$\begin{aligned} \text{At } x = 2, \lim_{x \rightarrow 2} \frac{2^x \cdot 2^2 - 2^4}{4^x - 4^2} &= \lim_{x \rightarrow 2} \frac{4 \cdot (2^x - 4)}{(2^x)^2 - (4)^2} \\ &= \lim_{x \rightarrow 2} \frac{4 \cdot (2^x - 4)}{(2^x - 4)(2^x + 4)} \quad [\because a^2 - b^2 = (a+b)(a-b)] \\ &= \lim_{x \rightarrow 2} \frac{4}{2^x + 4} = \frac{4}{8} = \frac{1}{2} \end{aligned}$$

But

$$f(2) = k$$

$$\therefore k = \frac{1}{2}$$

$$\text{Q. 13 } f(x) = \begin{cases} \frac{\sqrt{1+kx} - \sqrt{1-kx}}{x}, & \text{if } -1 \leq x < 0 \\ \frac{2x+1}{x-1}, & \text{if } 0 \leq x \leq 1 \end{cases} \text{ at } x = 0.$$

$$\text{Sol. We have, } f(x) = \begin{cases} \frac{\sqrt{1+kx} - \sqrt{1-kx}}{x}, & \text{if } -1 \leq x < 0 \\ \frac{2x+1}{x-1}, & \text{if } 0 \leq x \leq 1 \end{cases} \text{ at } x = 0.$$

∴

$$\begin{aligned}
 \text{LHL} &= \lim_{x \rightarrow 0^-} \frac{\sqrt{1+kx} - \sqrt{1-kx}}{x} \\
 &= \lim_{x \rightarrow 0^-} \left(\frac{\sqrt{1+kx} - \sqrt{1-kx}}{x} \right) \cdot \left(\frac{\sqrt{1+kx} + \sqrt{1-kx}}{\sqrt{1+kx} + \sqrt{1-kx}} \right) \\
 &= \lim_{x \rightarrow 0^-} \frac{1+kx - 1+kx}{x[\sqrt{1+kx} + \sqrt{1-kx}]} \\
 &= \lim_{x \rightarrow 0^-} \frac{2kx}{x\sqrt{1+kx} + \sqrt{1-kx}} \\
 &= \lim_{h \rightarrow 0} \frac{2k}{\sqrt{1+k(0-h)} + \sqrt{1-k(0-h)}} \\
 &= \lim_{h \rightarrow 0} \frac{2k}{\sqrt{1-kh} + \sqrt{1+kh}} = \frac{2k}{2} = k
 \end{aligned}$$

and

$$f(0) = \frac{2 \times 0 + 1}{0 - 1} = -1$$

⇒

$$k = -1$$

$$[\because \text{LHL} = \text{RHL} = f(0)]$$

Q. 14 $f(x) = \begin{cases} \frac{1 - \cos kx}{x \sin x}, & \text{if } x \neq 0 \\ \frac{1}{2}, & \text{if } x = 0 \end{cases}$

Sol. We have,

$$f(x) = \begin{cases} \frac{1 - \cos kx}{x \sin x}, & \text{if } x \neq 0 \\ \frac{1}{2}, & \text{if } x = 0 \end{cases}$$

At $x = 0$,

$$\begin{aligned}
 \text{LHL} &= \lim_{x \rightarrow 0^-} \frac{1 - \cos kx}{x \sin x} = \lim_{h \rightarrow 0} \frac{1 - \cos k(0-h)}{(0-h) \sin(0-h)} \\
 &= \lim_{h \rightarrow 0} \frac{1 - \cos(-kh)}{-h \sin(-h)} \\
 &= \lim_{h \rightarrow 0} \frac{1 - \cos kh}{h \sin h} \quad [\because \cos(-\theta) = \cos \theta, \sin(-\theta) = -\sin \theta]
 \end{aligned}$$

$$\begin{aligned}
 &= \lim_{h \rightarrow 0} \frac{1 - 1 + 2 \sin^2 \frac{kh}{2}}{h \sin h} \quad \left[\because \cos \theta = 1 - 2 \sin^2 \frac{\theta}{2} \right] \\
 &= \lim_{h \rightarrow 0} \frac{2 \sin^2 \frac{kh}{2}}{h \sin h}
 \end{aligned}$$

$$\begin{aligned}
 &= \lim_{h \rightarrow 0} \frac{2 \sin \frac{kh}{2}}{\frac{kh}{2}} \cdot \frac{\sin \frac{kh}{2}}{\frac{kh}{2}} \cdot \frac{1}{\frac{\sin h}{h}} \cdot \frac{k^2 h / 4}{h} \\
 &= \frac{2k^2}{4} = \frac{k^2}{2}
 \end{aligned}$$

$$\left[\because \lim_{h \rightarrow 0} \frac{\sin h}{h} = 1 \right]$$

Also,

$$f(0) = \frac{1}{2} \Rightarrow \frac{k^2}{2} = \frac{1}{2} \Rightarrow k = \pm 1 \quad p$$

Q. 15 Prove that the function f defined by $f(x) = \begin{cases} \frac{x}{|x| + 2x^2}, & \text{if } x \neq 0 \\ k, & \text{if } x = 0 \end{cases}$

remains discontinuous at $x = 0$, regardless the choice of k .

Sol. We have, $f(x) = \begin{cases} \frac{x}{|x| + 2x^2}, & \text{if } x \neq 0 \\ k, & \text{if } x = 0 \end{cases}$

$$\text{At } x = 0, \quad \text{LHL} = \lim_{x \rightarrow 0^-} \frac{x}{|x| + 2x^2} = \lim_{h \rightarrow 0} \frac{(0-h)}{|0-h| + 2(0-h)^2} \\ = \lim_{h \rightarrow 0} \frac{-h}{h+2h^2} = \lim_{h \rightarrow 0} \frac{-h}{h(1+2h)} = -1$$

$$\text{RHL} = \lim_{x \rightarrow 0^+} \frac{x}{|x| + 2x^2} = \lim_{h \rightarrow 0} \frac{0+h}{|0+h| + 2(0+h)^2} \\ = \lim_{h \rightarrow 0} \frac{h}{h+2h^2} = \lim_{h \rightarrow 0} \frac{h}{h(1+2h)} = 1$$

and $f(0) = k$

Since, $\text{LHL} \neq \text{RHL}$ for any value of k .

Hence, $f(x)$ is discontinuous at $x = 0$ regardless the choice of k .

Q. 16 Find the values of a and b such that the function f defined by

$$f(x) = \begin{cases} \frac{x-4}{|x-4|} + a, & \text{if } x < 4 \\ a+b, & \text{if } x = 4 \\ \frac{x-4}{|x-4|} + b, & \text{if } x > 4 \end{cases}$$

is a continuous function at $x = 4$.

Sol. We have,

$$f(x) = \begin{cases} \frac{x-4}{|x-4|} + a, & \text{if } x < 4 \\ a+b, & \text{if } x = 4 \\ \frac{x-4}{|x-4|} + b, & \text{if } x > 4 \end{cases}$$

At $x = 4$,

$$\text{LHL} = \lim_{x \rightarrow 4^-} \frac{x-4}{|x-4|} + a \\ = \lim_{h \rightarrow 0} \frac{4-h-4}{|4-h-4|} + a = \lim_{h \rightarrow 0} \frac{-h}{h} + a \\ = -1 + a$$

$$\text{RHL} = \lim_{x \rightarrow 4^+} \frac{x-4}{|x-4|} + b \\ = \lim_{h \rightarrow 0} \frac{4+h-4}{|4+h-4|} + b = \lim_{h \rightarrow 0} \frac{h}{h} + b = 1 + b$$

$$f(4) = a + b \Rightarrow -1 + a = 1 + b = a + b$$

$$\Rightarrow -1 + a = a + b \text{ and } 1 + b = a + b$$

$$\therefore b = -1 \text{ and } a = 1$$

Q. 17 If the function $f(x) = \frac{1}{x+2}$, then find the points of discontinuity of the composite function $y = f\{f(x)\}$.

Sol. We have,

$$f(x) = \frac{1}{x+2}$$

∴

$$\begin{aligned} y &= f\{f(x)\} \\ &= f\left(\frac{1}{x+2}\right) = \frac{1}{\frac{1}{x+2} + 2} \\ &= \frac{1}{1+2x+4} \cdot (x+2) = \frac{(x+2)}{(2x+5)} \end{aligned}$$

So, the function y will not be continuous at those points, where it is not defined as it is a rational function.

Therefore, $y = \frac{x+2}{(2x+5)}$ is not defined, when $2x+5=0$

$$\therefore x = \frac{-5}{2}$$

Hence, y is discontinuous at $x = \frac{-5}{2}$.

Q. 18 Find all points of discontinuity of the function $f(t) = \frac{1}{t^2+t-2}$, where

$$t = \frac{1}{x-1}.$$

Sol. We have,

$$f(t) = \frac{1}{t^2+t-2} \text{ and } t = \frac{1}{x-1}$$

∴

$$\begin{aligned} f(t) &= \frac{1}{\left(\frac{1}{x^2+1-2x}\right) + \left(\frac{1}{x-1}\right) - \frac{2}{1}} \\ &= \frac{1}{\left(\frac{1+x-1+[-2(x-1)^2]}{(x^2+1-2x)}\right)} \\ &= \frac{x^2+1-2x}{x-2x^2-2+4x} \\ &= \frac{x^2+1-2x}{-2x^2+5x-2} \\ &= \frac{(x-1)^2}{-(2x^2-5x+2)} \\ &= \frac{(x-1)^2}{(2x-1)(2-x)} \end{aligned}$$

So, $f(t)$ is discontinuous at $2x-1=0 \Rightarrow x=1/2$
and $2-x=0 \Rightarrow x=2$.

Q. 19 Show that the function $f(x) = |\sin x + \cos x|$ is continuous at $x = \pi$.

Sol. We have,

Let

and

∴

$$f(x) = |\sin x + \cos x| \text{ at } x = \pi$$

$$g(x) = \sin x + \cos x$$

$$h(x) = |x|$$

$$hog(x) = h[g(x)]$$

$$= h(\sin x + \cos x)$$

$$= |\sin x + \cos x|$$

Since, $g(x) = \sin x + \cos x$ is a continuous function as it is forming with addition of two continuous functions $\sin x$ and $\cos x$.

Also, $h(x) = |x|$ is also a continuous function. Since, we know that composite functions of two continuous functions is also a continuous function.

Hence, $f(x) = |\sin x + \cos x|$ is a continuous function everywhere.

So, $f(x)$ is continuous at $x = \pi$.

Q. 20 Examine the differentiability of f , where f is defined by

$$f(x) = \begin{cases} x[x], & \text{if } 0 \leq x < 2 \\ (x-1)x, & \text{if } 2 \leq x < 3 \end{cases} \text{ at } x = 2.$$

Thinking Process

We know that, a function f is differentiable at a point a in its domain, if both $Lf'(a)$ and

$$Rf'(a) \text{ are finite and equal, where } Lf'(c) = \lim_{h \rightarrow 0} \frac{f(a-h) - f(a)}{-h} \text{ and}$$

$$Rf'(c) = \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h}.$$

Sol. We have, $f(x) = \begin{cases} x[x], & \text{if } 0 \leq x < 2 \\ (x-1)x & \text{if } 2 \leq x < 3 \end{cases}$ at $x = 2$.

$$\text{At } x = 2, \quad Lf'(2) = \lim_{h \rightarrow 0} \frac{f(2-h) - f(2)}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{(2-h)[2-h] - (2-1)2}{-h}$$

{: [a-h] = [a-1], where a is any positive number}

$$= \lim_{h \rightarrow 0} \frac{(2-h)(1)-2}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{2-h-2}{-h} = \lim_{h \rightarrow 0} \frac{-h}{-h} = 1$$

$$Rf'(2) = \lim_{h \rightarrow 0} \frac{f(2+h) - f(2)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{(2+h-1)(2+h) - (2-1)\cdot 2}{h}$$

$$= \lim_{h \rightarrow 0} \frac{(1+h)(2+h)-2}{h}$$

$$= \lim_{h \rightarrow 0} \frac{2+h+2h+h^2-2}{h}$$

$$= \lim_{h \rightarrow 0} \frac{h^2+3h}{h} = \lim_{h \rightarrow 0} \frac{h(h+3)}{h} = 3$$

$$\therefore Lf'(2) \neq Rf'(2)$$

So, $f(x)$ is not differentiable at $x = 2$.

$$\text{Q. 21 } f(x) = \begin{cases} x^2 \sin \frac{1}{x}, & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases} \text{ at } x = 0.$$

$$\text{Sol. We have, } f(x) = \begin{cases} x^2 \sin \frac{1}{x}, & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases} \text{ at } x = 0$$

For differentiability at $x = 0$,

$$\begin{aligned} Lf'(0) &= \lim_{x \rightarrow 0^-} \frac{f(x) - f(0)}{x - 0} = \lim_{x \rightarrow 0^-} \frac{x^2 \sin \frac{1}{x} - 0}{x - 0} \\ &= \lim_{h \rightarrow 0} \frac{(0 - h)^2 \sin \left(\frac{1}{0 - h} \right)}{0 - h} = \lim_{h \rightarrow 0} \frac{h^2 \sin \left(\frac{-1}{h} \right)}{-h} \\ &= \lim_{h \rightarrow 0} + h \sin \left(\frac{1}{h} \right) \quad [\because \sin(-\theta) = -\sin \theta] \\ &= 0 \times [\text{an oscillating number between } -1 \text{ and } 1] = 0 \\ Rf'(0) &= \lim_{x \rightarrow 0^+} \frac{f(x) - f(0)}{x - 0} = \lim_{x \rightarrow 0^+} \frac{x^2 \sin \frac{1}{x} - 0}{x - 0} \\ &= \lim_{h \rightarrow 0} \frac{(0 + h)^2 \sin \left(\frac{1}{0 + h} \right)}{0 + h} = \lim_{h \rightarrow 0} \frac{h^2 \sin(1/h)}{h} \\ &= \lim_{h \rightarrow 0} h \sin(1/h) \\ &= 0 \times [\text{an oscillating number between } -1 \text{ and } 1] = 0 \end{aligned}$$

$$\therefore Lf'(0) = Rf'(0)$$

So, $f(x)$ is differentiable at $x = 0$.

$$\text{Q. 22 } f(x) = \begin{cases} 1 + x, & \text{if } x \leq 2 \\ 5 - x, & \text{if } x > 2 \end{cases} \text{ at } x = 2.$$

$$\text{Sol. We have, } f(x) = \begin{cases} 1 + x, & \text{if } x \leq 2 \\ 5 - x, & \text{if } x > 2 \end{cases} \text{ at } x = 2.$$

For differentiability at $x = 2$,

$$\begin{aligned} Lf'(2) &= \lim_{x \rightarrow 2^-} \frac{f(x) - f(2)}{x - 2} = \lim_{x \rightarrow 2^-} \frac{(1 + x) - (1 + 2)}{x - 2} \\ &= \lim_{h \rightarrow 0} \frac{(1 + 2 - h) - 3}{2 - h - 2} = \lim_{h \rightarrow 0} \frac{-h}{-h} = 1 \\ Rf'(2) &= \lim_{x \rightarrow 2^+} \frac{f(x) - f(2)}{x - 2} = \lim_{x \rightarrow 2^+} \frac{(5 - x) - 3}{x - 2} \\ &= \lim_{h \rightarrow 0} \frac{5 - (2 + h) - 3}{2 + h - 2} \\ &= \lim_{h \rightarrow 0} \frac{5 - 2 - h - 3}{h} = \lim_{h \rightarrow 0} \frac{-h}{h} \\ &= -1 \end{aligned}$$

$$\therefore Lf'(2) \neq Rf'(2)$$

So, $f(x)$ is not differentiable at $x = 2$.

Q. 23 Show that $f(x) = |x - 5|$ is continuous but not differentiable at $x = 5$.

Sol. We have,

\therefore

$$f(x) = \begin{cases} |x - 5| \\ -(x - 5), \text{ if } x < 5 \\ x - 5, \quad \text{if } x \geq 5 \end{cases}$$

For continuity at $x = 5$,

$$\begin{aligned} \text{LHL} &= \lim_{x \rightarrow 5^-} (-x + 5) \\ &= \lim_{h \rightarrow 0} [-(5 - h) + 5] = \lim_{h \rightarrow 0} h = 0 \end{aligned}$$

$$\begin{aligned} \text{RHL} &= \lim_{x \rightarrow 5^+} (x - 5) \\ &= \lim_{h \rightarrow 0} (5 + h - 5) = \lim_{h \rightarrow 0} h = 0 \end{aligned}$$

\therefore

$$\text{LHL} = \text{RHL} = f(5)$$

Hence, $f(x)$ is continuous at $x = 5$.

Now,

$$\begin{aligned} Lf'(5) &= \lim_{x \rightarrow 5^-} \frac{f(x) - f(5)}{x - 5} \\ &= \lim_{x \rightarrow 5^-} \frac{-x + 5 - 0}{x - 5} = -1 \\ Rf'(5) &= \lim_{x \rightarrow 5^+} \frac{f(x) - f(5)}{x - 5} \\ &= \lim_{x \rightarrow 5^+} \frac{x - 5 - 0}{x - 5} = 1 \end{aligned}$$

\therefore

$$Lf'(5) \neq Rf'(5)$$

So, $f(x) = |x - 5|$ is not differentiable at $x = 5$.

Q. 24 A function $f : R \rightarrow R$ satisfies the equation $f(x + y) = f(x) \cdot f(y)$ for all $x, y \in R$, $f(x) \neq 0$. Suppose that the function is differentiable at $x = 0$ and $f'(0) = 2$, then prove that $f'(x) = 2f(x)$.

Sol. Let $f : R \rightarrow R$ satisfies the equation $f(x + y) = f(x) \cdot f(y)$, $\forall x, y \in R$, $f(x) \neq 0$.

Let $f(x)$ is differentiable at $x = 0$ and $f'(0) = 2$.

$$\begin{aligned} \Rightarrow f'(0) &= \lim_{x \rightarrow 0} \frac{f(x) - f(0)}{x - 0} \\ \Rightarrow 2 &= \lim_{x \rightarrow 0} \frac{f(x) - f(0)}{x} \\ \Rightarrow 2 &= \lim_{h \rightarrow 0} \frac{f(0 + h) - f(0)}{0 + h} \\ \Rightarrow 2 &= \lim_{h \rightarrow 0} \frac{f(0) \cdot f(h) - f(0)}{h} \\ \Rightarrow 2 &= \lim_{h \rightarrow 0} \frac{f(0) [f(h) - 1]}{h} \quad [\because f(0) = f(h)] \dots (i) \end{aligned}$$

Also,

$$\begin{aligned} f'(x) &= \lim_{h \rightarrow 0} \frac{f(x + h) - f(x)}{h} \\ &= \lim_{h \rightarrow 0} \frac{f(x) \cdot f(h) - f(x)}{h} \quad [\because f(x + y) = f(x) \cdot f(y)] \\ &= \lim_{h \rightarrow 0} \frac{f(x) [f(h) - 1]}{h} = 2f(x) \quad [\text{using Eq. (i)}] \end{aligned}$$

\therefore

$$f'(x) = 2f(x)$$

Q. 25 $2^{\cos^2 x}$

Sol. Let

$$y = 2^{\cos^2 x}$$

$$\therefore \log y = \log 2^{\cos^2 x} = \cos^2 x \cdot \log 2$$

On differentiating w.r.t. x , we get

$$\begin{aligned} & \frac{d}{dy} \log y \cdot \frac{dy}{dx} = \frac{d}{dx} \log 2 \cdot \cos^2 x \\ \Rightarrow & \frac{1}{y} \cdot \frac{dy}{dx} = \log 2 \frac{d}{dx} (\cos x)^2 \\ \Rightarrow & \frac{1}{y} \cdot \frac{dy}{dx} = \log 2 \cdot [2 \cos x] \cdot \frac{d}{dx} \cos x \\ & = \log 2 \cdot 2 \cos x \cdot (-\sin x) \\ & = \log 2 \cdot [-(\sin 2x)] \\ \therefore & \frac{dy}{dx} = -y \cdot \log 2 (\sin 2x) \\ & = -2^{\cos^2 x} \cdot \log 2 (\sin 2x) \end{aligned}$$

Q. 26 $\frac{8^x}{x^8}$

Sol. Let

$$y = \frac{8^x}{x^8} \Rightarrow \log y = \log \frac{8^x}{x^8}$$

$$\begin{aligned} \Rightarrow & \frac{d}{dy} \log y \cdot \frac{dy}{dx} = \frac{d}{dx} [\log 8^x - \log x^8] \\ \Rightarrow & \frac{1}{y} \cdot \frac{dy}{dx} = \frac{d}{dx} [x \cdot \log 8 - 8 \cdot \log x] \end{aligned}$$

On differentiating w.r.t. x , we get

$$\begin{aligned} & \frac{1}{y} \cdot \frac{dy}{dx} = \log 8 \cdot 1 - 8 \cdot \frac{1}{x} \\ \Rightarrow & \frac{1}{y} \cdot \frac{dy}{dx} = \log 8 - \frac{8}{x} \\ \therefore & \frac{dy}{dx} = y \left(\log 8 - \frac{8}{x} \right) = \frac{8^x}{x^8} \left(\log 8 - \frac{8}{x} \right) \end{aligned}$$

Q. 27 $\log(x + \sqrt{x^2 + a})$

Sol. Let

$$\begin{aligned} & y = \log(x + \sqrt{x^2 + a}) \\ \therefore & \frac{dy}{dx} = \frac{d}{dx} \log(x + \sqrt{x^2 + a}) \\ & = \frac{1}{(x + \sqrt{x^2 + a})} \cdot \frac{d}{dx} [x + \sqrt{x^2 + a}] \\ & = \frac{1}{(x + \sqrt{x^2 + a})} \left[1 + \frac{1}{2} (x^2 + a)^{-1/2} \cdot 2x \right] \\ & = \frac{1}{(x + \sqrt{x^2 + a})} \cdot \left(1 + \frac{x}{\sqrt{x^2 + a}} \right) \\ & = \frac{(\sqrt{x^2 + a} + x)}{(x + \sqrt{x^2 + a})(\sqrt{x^2 + a})} = \frac{1}{(\sqrt{x^2 + a})} \end{aligned}$$

Q. 28 $\log [\log (\log x^5)]$

Sol. Let

$$\begin{aligned} y &= \log [\log (\log x^5)] \\ \therefore \frac{dy}{dx} &= \frac{d}{dx} [\log (\log \log x^5)] \\ &= \frac{1}{\log \log x^5} \cdot \frac{d}{dx} (\log \log x^5) \\ &= \frac{1}{\log \log x^5} \cdot \left(\frac{1}{\log x^5} \right) \cdot \frac{d}{dx} \log x^5 \\ &= \frac{1}{\log \log x^5} \cdot \frac{1}{\log x^5} \cdot \frac{d}{dx} (5 \log x) = \frac{5}{x \cdot \log (\log x^5) \cdot \log (x^5)} \end{aligned}$$

Q. 29 $\sin \sqrt{x} + \cos^2 \sqrt{x}$

Sol. Let

$$\begin{aligned} y &= \sin \sqrt{x} + (\cos \sqrt{x})^2 \\ \therefore \frac{dy}{dx} &= \frac{d}{dx} \sin(x^{1/2}) + \frac{d}{dx} [\cos(x^{1/2})]^2 \\ &= \cos x^{1/2} \cdot \frac{d}{dx} x^{1/2} + 2 \cos(x^{1/2}) \cdot \frac{d}{dx} [\cos(x^{1/2})] \\ &= \cos(x^{1/2}) \cdot \frac{1}{2} x^{-1/2} + 2 \cdot \cos(x^{1/2}) \cdot \left[-\sin(x^{1/2}) \cdot \frac{d}{dx} x^{1/2} \right] \\ &= \cos \sqrt{x} \cdot \frac{1}{2\sqrt{x}} [-2 \cos(x^{1/2})] \cdot \sin x^{1/2} \cdot \frac{1}{2\sqrt{x}} \\ &= \frac{1}{2\sqrt{x}} [\cos(\sqrt{x}) - \sin(2\sqrt{x})] \end{aligned}$$

Q. 30 $\sin^n (ax^2 + bx + c)$

Sol. Let $y = \sin^n (ax^2 + bx + c)$

$$\begin{aligned} \therefore \frac{dy}{dx} &= \frac{d}{dx} [\sin(ax^2 + bx + c)]^n \\ &= n \cdot [\sin(ax^2 + bx + c)]^{n-1} \cdot \frac{d}{dx} \sin(ax^2 + bx + c) \\ &= n \cdot \sin^{n-1}(ax^2 + bx + c) \cdot \cos(ax^2 + bx + c) \cdot \frac{d}{dx}(ax^2 + bx + c) \\ &= n \cdot \sin^{n-1}(ax^2 + bx + c) \cdot \cos(ax^2 + bx + c) \cdot (2ax + b) \\ &= n \cdot (2ax + b) \cdot \sin^{n-1}(ax^2 + bx + c) \cdot \cos(ax^2 + bx + c) \end{aligned}$$

Q. 31 $\cos(\tan \sqrt{x+1})$

Sol. Let

$$\begin{aligned} y &= \cos(\tan \sqrt{x+1}) \\ \therefore \frac{dy}{dx} &= \frac{d}{dx} \cos(\tan \sqrt{x+1}) = -\sin(\tan \sqrt{x+1}) \cdot \frac{d}{dx} (\tan \sqrt{x+1}) \\ &= -\sin(\tan \sqrt{x+1}) \cdot \sec^2 \sqrt{x+1} \cdot \frac{d}{dx} (x+1)^{1/2} & \left[\because \frac{d}{dx} (\tan x) = \sec^2 x \right] \\ &= -\sin(\tan \sqrt{x+1}) \cdot (\sec \sqrt{x+1})^2 \cdot \frac{1}{2} (x+1)^{-1/2} \cdot \frac{d}{dx} (x+1) \\ &= \frac{-1}{2\sqrt{x+1}} \cdot \sin(\tan \sqrt{x+1}) \cdot \sec^2(\sqrt{x+1}) \end{aligned}$$

Q. 32 $\sin x^2 + \sin^2 x + \sin^2(x^2)$

Sol. Let

$$\begin{aligned} y &= \sin x^2 + \sin^2 x + \sin^2(x^2) \\ \therefore \frac{dy}{dx} &= \frac{d}{dx} \sin(x^2) + \frac{d}{dx} (\sin x)^2 + \frac{d}{dx} (\sin x^2)^2 \\ &= \cos(x^2) \frac{d}{dx}(x^2) + 2 \sin x \cdot \frac{d}{dx} \sin x + 2 \sin x^2 \cdot \frac{d}{dx} \sin x^2 \\ &= \cos x^2 2x + 2 \cdot \sin x \cdot \cos x + 2 \sin x^2 \cos x^2 \cdot \frac{d}{dx} x^2 \\ &= 2x \cos(x^2) + 2 \cdot \sin x \cdot \cos x + 2 \sin x^2 \cdot \cos x^2 \cdot 2x \\ &= 2x \cos(x^2) + \sin 2x + \sin 2(x^2) \cdot 2x \\ &= 2x \cos(x^2) + 2x \cdot \sin 2(x^2) + \sin 2x \end{aligned}$$

Q. 33 $\sin^{-1} \frac{1}{\sqrt{x+1}}$

Sol. Let

$$\begin{aligned} y &= \sin^{-1} \frac{1}{\sqrt{x+1}} \\ \therefore \frac{dy}{dx} &= \frac{d}{dx} \sin^{-1} \frac{1}{\sqrt{x+1}} \\ &= \frac{1}{\sqrt{1 - \left(\frac{1}{\sqrt{x+1}}\right)^2}} \cdot \frac{d}{dx} \frac{1}{(x+1)^{1/2}} \quad \left[\because \frac{d}{dx} (\sin^{-1} x) = \frac{1}{\sqrt{1-x^2}} \right] \\ &= \frac{1}{\sqrt{\frac{x+1-1}{x+1}}} \cdot \frac{d}{dx} (x+1)^{-1/2} \\ &= \sqrt{\frac{x+1}{x}} \cdot \frac{-1}{2} (x+1)^{-\frac{1}{2}-1} \cdot \frac{d}{dx} (x+1) \\ &= \frac{(x+1)^{1/2}}{x^{1/2}} \cdot \left(-\frac{1}{2}\right) (x+1)^{-3/2} = \frac{-1}{2\sqrt{x}} \cdot \left(\frac{1}{x+1}\right) \end{aligned}$$

Q. 34 $(\sin x)^{\cos x}$

Sol. Let

$$\begin{aligned} y &= (\sin x)^{\cos x} \\ \Rightarrow \log y &= \log(\sin x)^{\cos x} = \cos x \log \sin x \\ \therefore \frac{d}{dy} \log y \cdot \frac{dy}{dx} &= \frac{d}{dx} (\cos x \cdot \log \sin x) \\ \Rightarrow \frac{1}{y} \cdot \frac{dy}{dx} &= \cos x \cdot \frac{d}{dx} \log \sin x + \log \sin x \cdot \frac{d}{dx} \cos x \\ &= \cos x \cdot \frac{1}{\sin x} \cdot \frac{d}{dx} \sin x + \log \sin x \cdot (-\sin x) \\ &= \cot x \cdot \cos x - \log(\sin x) \cdot \sin x \quad \left[\because \cot x = \frac{\cos x}{\sin x} \right] \\ \therefore \frac{dy}{dx} &= y \left[\frac{\cos^2 x}{\sin x} - \sin x \cdot \log(\sin x) \right] \\ &= \sin x^{\cos x} \left[\frac{\cos^2 x}{\sin x} - \sin x \cdot \log(\sin x) \right] \end{aligned}$$

Q. 35 $\sin^m x \cdot \cos^n x$

Sol. Let $y = \sin^m x \cdot \cos^n x$

$$\begin{aligned} \therefore \frac{dy}{dx} &= \frac{d}{dx} [(\sin x)^m \cdot (\cos x)^n] \\ &= (\sin x)^m \cdot \frac{d}{dx} (\cos x)^n + (\cos x)^n \cdot \frac{d}{dx} (\sin x)^m \\ &= (\sin x)^m \cdot n (\cos x)^{n-1} \cdot \frac{d}{dx} \cos x + (\cos x)^n m (\sin x)^{m-1} \cdot \frac{d}{dx} \sin x \\ &= (\sin x)^m \cdot n (\cos x)^{n-1} (-\sin x) + (\cos x)^n \cdot m (\sin x)^{m-1} \cos x \\ &= -n \sin^m x \cdot \cos^{n-1} x \cdot (\sin x) + m \cos^n x \cdot \sin^{m-1} x \cdot \cos x \\ &= -n \cdot \sin^m x \cdot \sin x \cdot \cos^n x \cdot \frac{1}{\cos x} + m \cdot \sin^m x \cdot \frac{1}{\sin x} \cdot \cos^n x \cdot \cos x \\ &= -n \cdot \sin^m x \cdot \cos^n x \cdot \tan x + m \sin^m x \cdot \cos^n x \cdot \cot x \\ &= \sin^m x \cdot \cos^n x [-n \tan x + m \cot x] \end{aligned}$$

Q. 36 $(x+1)^2(x+2)^3(x+3)^4$

Sol. Let $y = (x+1)^2(x+2)^3(x+3)^4$

$$\begin{aligned} \therefore \log y &= \log \{(x+1)^2 \cdot (x+2)^3(x+3)^4\} \\ &= \log(x+1)^2 + \log(x+2)^3 + \log(x+3)^4 \\ \text{and } \frac{d}{dy} \log y \cdot \frac{dy}{dx} &= \frac{d}{dx}[2 \log(x+1)] + \frac{d}{dx}[3 \log(x+2)] + \frac{d}{dx}[4 \log(x+3)] \\ \frac{1}{y} \cdot \frac{dy}{dx} &= \frac{2}{(x+1)} \cdot \frac{d}{dx}(x+1) + 3 \cdot \frac{1}{(x+2)} \cdot \frac{d}{dx}(x+2) \\ &\quad + 4 \cdot \frac{1}{(x+3)} \cdot \frac{d}{dx}(x+3) \quad \left[\because \frac{d}{dx}(\log x) = \frac{1}{x} \right] \\ &= \left[\frac{2}{x+1} + \frac{3}{x+2} + \frac{4}{x+3} \right] \\ \therefore \frac{dy}{dx} &= y \left[\frac{2}{(x+1)} + \frac{3}{(x+2)} + \frac{4}{(x+3)} \right] \\ &= (x+1)^2 \cdot (x+2)^3 \cdot (x+3)^4 \left[\frac{2}{(x+1)} + \frac{3}{(x+2)} + \frac{4}{(x+3)} \right] \\ &= (x+1)^2 \cdot (x+2)^3 \cdot (x+3)^4 \\ &\quad \left[\frac{2(x+2)(x+3) + 3(x+1)(x+3) + 4(x+1)(x+2)}{(x+1)(x+2)(x+3)} \right] \\ &= \frac{(x+1)^2(x+2)^3(x+3)^4}{(x+1)(x+2)(x+3)} \\ &= [2(x^2 + 5x + 6) + 3(x^2 + 4x + 3) + 4(x^2 + 3x + 2)] \\ &= (x+1)(x+2)^2(x+3)^3 \\ &\quad [2x^2 + 10x + 12 + 3x^2 + 12x + 9 + 4x^2 + 12x + 8] \\ &= (x+1)(x+2)^2(x+3)^3[9x^2 + 34x + 29] \end{aligned}$$

$$\text{Q. 37} \cos^{-1} \left(\frac{\sin x + \cos x}{\sqrt{2}} \right), -\frac{\pi}{4} < x < \frac{\pi}{4}$$

Sol. Let

$$y = \cos^{-1} \left(\frac{\sin x + \cos x}{\sqrt{2}} \right)$$

$$\begin{aligned} \therefore \frac{dy}{dx} &= \frac{d}{dx} \cos^{-1} \left(\frac{\sin x + \cos x}{\sqrt{2}} \right) \\ &= \frac{-1}{\sqrt{1 - \left(\frac{\sin x + \cos x}{\sqrt{2}} \right)^2}} \cdot \frac{d}{dx} \left(\frac{\sin x + \cos x}{\sqrt{2}} \right) \\ &= \frac{-1}{\sqrt{4 - \frac{(\sin^2 x + \cos^2 x + 2 \sin x \cdot \cos x)}{2}}} \cdot \frac{1}{\sqrt{2}} (\cos x - \sin x) \\ &= \frac{-1 \cdot \sqrt{2}}{\sqrt{1 - \sin 2x}} \cdot \frac{1}{\sqrt{2}} (\cos x - \sin x) \\ &\quad [\because 1 - \sin 2x = (\cos x - \sin x)^2 = \cos^2 x + \sin^2 x - 2 \sin x \cos x] \\ &= \frac{-1 (\cos x - \sin x)}{(\cos x - \sin x)} = -1 \end{aligned}$$

$$\text{Q. 38} \tan^{-1} \sqrt{\frac{1 - \cos x}{1 + \cos x}}, -\frac{\pi}{4} < x < \frac{\pi}{4}$$

Sol. Let

$$y = \tan^{-1} \sqrt{\frac{1 - \cos x}{1 + \cos x}}$$

$$\begin{aligned} \therefore \frac{dy}{dx} &= \frac{d}{dx} \tan^{-1} \sqrt{\frac{1 - \cos x}{1 + \cos x}} \\ &= \frac{1}{1 + \sqrt{\frac{(1 - \cos x)^2}{(1 + \cos x)^2}}} \cdot \frac{d}{dx} \left[\frac{1 - \cos x}{1 + \cos x} \right]^{1/2} \quad [\because \frac{d}{dx} (\tan^{-1} x) = \frac{1}{1 + x^2}] \\ &= \frac{1}{1 + \frac{1 - \cos x}{1 + \cos x}} \cdot \frac{1}{2} \left[\frac{1 - \cos x}{1 + \cos x} \right]^{-1/2} \cdot \frac{d}{dx} \left(\frac{1 - \cos x}{1 + \cos x} \right) \\ &= \frac{1}{1 + \cos x + 1 - \cos x} \cdot \frac{1}{2} \left[\frac{(1 - \cos x) \cdot (1 - \cos x)}{(1 + \cos x) \cdot (1 - \cos x)} \right]^{-1/2} \\ &\quad \frac{(1 + \cos x) \cdot \sin x + (1 - \cos x) \cdot \sin x}{(1 + \cos x)^2} \\ &= \frac{(1 + \cos x) \cdot \frac{1}{2} \left[\frac{(1 - \cos x)^2}{(1 - \cos^2 x)} \right]^{-1/2} \left[\frac{\sin x (1 + \cos x + 1 - \cos x)}{(1 + \cos x)^2} \right]}{2} \\ &= \frac{(1 + \cos x) \cdot \frac{1}{2} \left[\frac{(1 - \cos x)^2}{(1 - \cos^2 x)} \right]^{-1/2} \left[\frac{\sin x (1 + \cos x + 1 - \cos x)}{(1 + \cos x)^2} \right]}{2} \end{aligned}$$

$$\begin{aligned}
&= \frac{(1+\cos x)}{2} \cdot \frac{1}{2} \left[\frac{(1-\cos x)^2}{\sin x} \right]^{-1/2} \cdot \frac{2 \sin x}{(1+\cos x)^2} \\
&= \frac{(1+\cos x)}{2} \cdot \frac{1}{2} \cdot \frac{\sin x}{(1-\cos x)} \cdot \frac{2 \sin x}{(1+\cos x)^2} \\
&= \frac{2 \sin^2 x}{4(1+\cos x)(1-\cos x)} = \frac{1}{2} \cdot \frac{\sin^2 x}{(1-\cos^2 x)} \\
&= \frac{1}{2} \cdot \frac{\sin^2 x}{\sin^2 x} = \frac{1}{2}
\end{aligned}$$

Alternate Method

$$\begin{aligned}
\text{Let } y &= \tan^{-1} \left(\sqrt{\frac{1-\cos x}{1+\cos x}} \right) \\
&= \tan^{-1} \left(\sqrt{\frac{1-1+2\sin^2 \frac{x}{2}}{1+2\cos^2 \frac{x}{2}-1}} \right) \quad \left[\because \cos x = 1 - 2\sin^2 \frac{x}{2} = 2\cos^2 \frac{x}{2} - 1 \right] \\
&= \tan^{-1} \left(\tan \frac{x}{2} \right) = \frac{x}{2}
\end{aligned}$$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = \frac{1}{2}$$

Q. 39 $\tan^{-1} (\sec x + \tan x)$, $\frac{-\pi}{2} < x < \frac{\pi}{2}$

Sol. Let $y = \tan^{-1} (\sec x + \tan x)$

$$\begin{aligned}
\therefore \frac{dy}{dx} &= \frac{d}{dx} \tan^{-1} (\sec x + \tan x) \\
&= \frac{1}{1 + (\sec x + \tan x)^2} \cdot \frac{d}{dx} (\sec x + \tan x) \quad \left[\because \frac{d}{dx} (\tan^{-1} x) = \frac{1}{1+x^2} \right] \\
&= \frac{1}{1 + \sec^2 x + \tan^2 x + 2\sec x \cdot \tan x} \cdot [\sec x \cdot \tan x + \sec^2 x] \\
&= \frac{1}{(\sec^2 x + \sec^2 x + 2\sec x \cdot \tan x)} \cdot \sec x \cdot (\sec x + \tan x) \\
&= \frac{1}{2 \sec x (\tan x + \sec x)} \cdot \sec x (\sec x + \tan x) = \frac{1}{2}
\end{aligned}$$

Q. 40 $\tan^{-1} \left(\frac{a \cos x - b \sin x}{b \cos x + a \sin x} \right)$, $\frac{-\pi}{2} < x < \frac{\pi}{2}$ and $\frac{a}{b} \tan x > -1$.

Sol. Let $y = \tan^{-1} \left(\frac{a \cos x - b \sin x}{b \cos x + a \sin x} \right)$

$$\begin{aligned}
&= \tan^{-1} \left[\frac{\frac{a \cos x}{b \cos x} - \frac{b \sin x}{b \cos x}}{\frac{b \cos x}{b \cos x} + \frac{a \sin x}{b \cos x}} \right] = \tan^{-1} \left[\frac{\frac{a}{b} - \tan x}{1 + \frac{a}{b} \tan x} \right] \\
&= \tan^{-1} \frac{a}{b} - \tan^{-1} \tan x \quad \left[\because \tan^{-1} x - \tan^{-1} y = \tan^{-1} \left(\frac{x-y}{1+xy} \right) \right]
\end{aligned}$$

$$\begin{aligned}
&= \tan^{-1} \frac{a}{b} - x \\
\therefore \frac{dy}{dx} &= \frac{d}{dx} \left(\tan^{-1} \frac{a}{b} \right) - \frac{d}{dx} (x) \\
&= 0 - 1 \\
&= -1
\end{aligned}
\quad \left[\because \frac{d}{dx} \left(\frac{a}{b} \right) = 0 \right]$$

Q. 41 $\sec^{-1} \left(\frac{1}{4x^3 - 3x} \right), 0 < x < \frac{1}{\sqrt{2}}$

Sol. Let $y = \sec^{-1} \left(\frac{1}{4x^3 - 3x} \right)$... (i)

On putting $x = \cos \theta$ in Eq. (i), we get

$$\begin{aligned}
y &= \sec^{-1} \frac{1}{4\cos^3 \theta - 3\cos \theta} \\
&= \sec^{-1} \frac{1}{\cos 3\theta} \\
&= \sec^{-1} (\sec 3\theta) = 3\theta \\
&= 3\cos^{-1} x \\
\therefore \frac{dy}{dx} &= \frac{d}{dx} (3\cos^{-1} x) \\
&= 3 \cdot \frac{-1}{\sqrt{1-x^2}}
\end{aligned}
\quad [\because \theta = \cos^{-1} x]$$

Q. 42 $\tan^{-1} \left(\frac{3a^2 x - x^3}{a^3 - 3ax^2} \right), \frac{-1}{\sqrt{3}} < \frac{x}{a} < \frac{1}{\sqrt{3}}$

Sol. Let $y = \tan^{-1} \left(\frac{3a^2 x - x^3}{a^3 - 3ax^2} \right)$

Put $x = a\tan \theta \Rightarrow \theta = \tan^{-1} \frac{x}{a}$

$$\begin{aligned}
\therefore y &= \tan^{-1} \left[\frac{3\tan \theta - \tan^3 \theta}{1 - 3\tan^2 \theta} \right] \\
&= \tan^{-1} (\tan 3\theta) = 3\theta \\
&= 3\tan^{-1} \frac{x}{a}
\end{aligned}
\quad \left[\because \tan 3\theta = \frac{3\tan \theta - \tan^3 \theta}{1 - 3\tan^2 \theta} \right]$$

$$\begin{aligned}
\therefore \frac{dy}{dx} &= 3 \cdot \frac{d}{dx} \tan^{-1} \frac{x}{a} = 3 \cdot \left[\frac{1}{1 + \frac{x^2}{a^2}} \right] \cdot \frac{d}{dx} \left(\frac{x}{a} \right) \\
&= 3 \cdot \frac{a^2}{a^2 + x^2} \cdot \frac{1}{a} = \frac{3a}{a^2 + x^2}
\end{aligned}$$

$$\text{Q. 43} \tan^{-1} \left[\frac{\sqrt{1+x^2} + \sqrt{1-x^2}}{\sqrt{1+x^2} - \sqrt{1-x^2}} \right], -1 < x < 1, x \neq 0$$

Sol. Let

$$y = \tan^{-1} \left[\frac{\sqrt{1+x^2} + \sqrt{1-x^2}}{\sqrt{1+x^2} - \sqrt{1-x^2}} \right]$$

Put

$$x^2 = \cos 2\theta$$

∴

$$\begin{aligned} y &= \tan^{-1} \left(\frac{\sqrt{1+\cos 2\theta} + \sqrt{1-\cos 2\theta}}{\sqrt{1+\cos 2\theta} - \sqrt{1-\cos 2\theta}} \right) \\ &= \tan^{-1} \left(\frac{\sqrt{1+2\cos^2\theta-1} + \sqrt{1-1+2\sin^2\theta}}{\sqrt{1+2\cos^2\theta-1} - \sqrt{1-1+2\sin^2\theta}} \right) \\ &= \tan^{-1} \left(\frac{\sqrt{2}\cos\theta + \sqrt{2}\sin\theta}{\sqrt{2}\cos\theta - \sqrt{2}\sin\theta} \right) = \tan^{-1} \left[\frac{\sqrt{2}(\cos\theta + \sin\theta)}{\sqrt{2}(\cos\theta - \sin\theta)} \right] \\ &= \tan^{-1} \left(\frac{\cos\theta + \sin\theta}{\cos\theta - \sin\theta} \right) = \tan^{-1} \left(\frac{\frac{\cos\theta + \sin\theta}{\cos\theta}}{\frac{\cos\theta - \sin\theta}{\cos\theta}} \right) \\ &= \tan^{-1} \left(\frac{1 + \tan\theta}{1 - \tan\theta} \right) \\ &= \tan^{-1} \tan \left(\frac{\pi}{4} + \theta \right) \quad \left[\because \tan(a+b) = \frac{\tan a + \tan b}{1 - \tan a \cdot \tan b} \right] \\ &= \frac{\pi}{4} + \theta = \frac{\pi}{4} + \frac{1}{2} \cos^{-1} x^2 \quad \left[\because 2\theta = \cos^{-1} x^2 \Rightarrow \theta = \frac{1}{2} \cos^{-1} x^2 \right] \end{aligned}$$

∴

$$\begin{aligned} \frac{dy}{dx} &= \frac{d}{dx} \left(\frac{\pi}{4} + \theta \right) + \frac{d}{dx} \left(\frac{1}{2} \cos^{-1} x^2 \right) \\ &= 0 + \frac{1}{2} \cdot \frac{-1}{\sqrt{1-x^4}} \cdot \frac{d}{dx} x^2 = \frac{1}{2} \cdot \frac{-2x}{\sqrt{1-x^4}} = \frac{-x}{\sqrt{1-x^4}} \end{aligned}$$

Find $\frac{dy}{dx}$ of each of the functions expressed in parametric form.

$$\text{Q. 44} x = t + \frac{1}{t}, y = t - \frac{1}{t}$$

$$\text{Sol.} \because x = t + \frac{1}{t} \text{ and } y = t - \frac{1}{t}$$

$$\therefore \frac{dx}{dt} = \frac{d}{dt} \left(t + \frac{1}{t} \right) \text{ and } \frac{dy}{dt} = \frac{d}{dt} \left(t - \frac{1}{t} \right)$$

$$\Rightarrow \frac{dx}{dt} = 1 + (-1)t^{-2} \text{ and } \frac{dy}{dt} = 1 - (-1)t^{-2}$$

$$\Rightarrow \frac{dx}{dt} = 1 - \frac{1}{t^2} \text{ and } \frac{dy}{dt} = 1 + \frac{1}{t^2}$$

$$\Rightarrow \frac{dx}{dt} = \frac{t^2 - 1}{t^2} \text{ and } \frac{dy}{dt} = \frac{t^2 + 1}{t^2}$$

$$\therefore \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{t^2 + 1/t^2}{t^2 - 1/t^2} = \frac{t^2 + 1}{t^2 - 1}$$

$$\text{Q. 45 } x = e^\theta \left(\theta + \frac{1}{\theta} \right), y = e^{-\theta} \left(\theta - \frac{1}{\theta} \right)$$

Sol. $\because x = e^\theta \left(\theta + \frac{1}{\theta} \right) \text{ and } y = e^{-\theta} \left(\theta - \frac{1}{\theta} \right)$

$$\begin{aligned} \therefore \frac{dx}{d\theta} &= \frac{d}{d\theta} \left[e^\theta \cdot \left(\theta + \frac{1}{\theta} \right) \right] \\ &= e^\theta \cdot \frac{d}{d\theta} \left(\theta + \frac{1}{\theta} \right) + \left(\theta + \frac{1}{\theta} \right) \cdot \frac{d}{d\theta} e^\theta \\ &= e^\theta \left(1 - \frac{1}{\theta^2} \right) + \left(\theta + \frac{1}{\theta} \right) e^\theta \\ &= e^\theta \left(1 - \frac{1}{\theta^2} + \theta + \frac{1}{\theta} \right) \\ &= e^\theta \left(\frac{\theta^2 - 1 + \theta^3 + \theta}{\theta^2} \right) \end{aligned} \quad \dots(i)$$

and

$$\begin{aligned} \frac{dy}{d\theta} &= \frac{d}{d\theta} \left[e^{-\theta} \cdot \left(\theta - \frac{1}{\theta} \right) \right] \\ &= e^{-\theta} \cdot \frac{d}{d\theta} \left(\theta - \frac{1}{\theta} \right) + \frac{d}{d\theta} e^{-\theta} \left(\theta - \frac{1}{\theta} \right) \\ &= e^{-\theta} \left(1 + \frac{1}{\theta^2} \right) + \left(\theta - \frac{1}{\theta} \right) e^{-\theta} \cdot \frac{d}{d\theta} (-\theta) \\ &= e^{-\theta} \left[\frac{\theta^2 + 1}{\theta^2} - \frac{\theta^2 - 1}{\theta} \right] = e^{-\theta} \left[\frac{\theta^2 + 1 - \theta^3 + \theta}{\theta^2} \right] \end{aligned} \quad \dots(ii)$$

$$\begin{aligned} \therefore \frac{dy}{dx} &= \frac{dy/d\theta}{dx/d\theta} = \frac{e^{-\theta} \left(\frac{\theta^2 + 1 - \theta^3 + \theta}{\theta^2} \right)}{e^\theta \left(\frac{\theta^2 - 1 + \theta^3 + \theta}{\theta^2} \right)} \\ &= e^{-2\theta} \left(\frac{-\theta^3 + \theta^2 + \theta + 1}{\theta^3 + \theta^2 + \theta - 1} \right) \end{aligned}$$

$$\text{Q. 46 } x = 3\cos \theta - 2\cos^3 \theta, y = 3\sin \theta - 2\sin^3 \theta$$

Sol. $\because x = 3\cos \theta - 2\cos^3 \theta \text{ and } y = 3\sin \theta - 2\sin^3 \theta$

$$\begin{aligned} \therefore \frac{dx}{d\theta} &= \frac{d}{d\theta} (3\cos \theta) - \frac{d}{d\theta} (2\cos^3 \theta) \\ &= 3 \cdot (-\sin \theta) - 2 \cdot 3\cos^2 \theta \cdot \frac{d}{d\theta} \cos \theta \\ &= -3\sin \theta + 6\cos^2 \theta \sin \theta \end{aligned}$$

and

$$\begin{aligned} \frac{dy}{d\theta} &= 3\cos \theta - 2 \cdot 3\sin^2 \theta \cdot \frac{d}{d\theta} \sin \theta \\ &= 3\cos \theta - 6\sin^2 \theta \cos \theta \end{aligned}$$

Now,

$$\begin{aligned} \frac{dy}{dx} &= \frac{dy/d\theta}{dx/d\theta} = \frac{3\cos \theta - 6\sin^2 \theta \cos \theta}{-3\sin \theta + 6\cos^2 \theta \sin \theta} \\ &= \frac{3\cos \theta (1 - 2\sin^2 \theta)}{3\sin \theta (-1 + 2\cos^2 \theta)} = \cot \theta \cdot \frac{\cos 2\theta}{\cos 2\theta} = \cot \theta \end{aligned}$$

$$\text{Q. 47} \sin x = \frac{2t}{1+t^2}, \tan y = \frac{2t}{1-t^2}$$

$$\text{Sol.} \because \sin x = \frac{2t}{1+t^2} \quad \dots(i)$$

$$\text{and} \quad \tan y = \frac{2t}{1-t^2} \quad \dots(ii)$$

$$\begin{aligned} \therefore \quad & \frac{d}{dx} \sin x \cdot \frac{dx}{dt} = \frac{d}{dt} \left(\frac{2t}{1+t^2} \right) \\ \Rightarrow \quad & \cos x \frac{dx}{dt} = \frac{(1+t^2) \cdot \frac{d}{dt}(2t) - (2t) \cdot \frac{d}{dt}(1+t^2)}{(1+t^2)^2} \\ & = \frac{2(1+t^2) - 2t \cdot 2t}{(1+t^2)^2} = \frac{2+2t^2-4t^2}{(1+t^2)^2} \\ \Rightarrow \quad & \frac{dx}{dt} = \frac{2(1-t^2)}{(1+t^2)^2} \cdot \frac{1}{\cos x} \\ \Rightarrow \quad & \frac{dx}{dt} = \frac{2(1-t^2)}{(1+t^2)^2} \cdot \frac{1}{\sqrt{1-\sin^2 x}} = \frac{2(1-t^2)}{(1+t^2)^2} \cdot \frac{1}{\sqrt{1-\left(\frac{2t}{1+t^2}\right)^2}} \\ \Rightarrow \quad & \frac{dx}{dt} = \frac{2(1-t^2)}{(1+t^2)^2} \cdot \frac{(1+t^2)}{(1-t^2)} = \frac{2}{1+t^2} \quad \dots(iii) \end{aligned}$$

$$\begin{aligned} \text{Also,} \quad & \frac{d}{dy} \tan y \cdot \frac{dy}{dt} = \frac{d}{dt} \left(\frac{2t}{1-t^2} \right) \\ & \sec^2 y \frac{dy}{dt} = \frac{(1-t^2) \frac{d}{dt}(2t) - 2t \cdot \frac{d}{dt}(1-t^2)}{(1-t^2)^2} \\ & \frac{dy}{dt} = \frac{2-2t^2+4t^2}{(1-t^2)^2} \cdot \frac{1}{\sec^2 y} \\ & = \frac{2(1+t^2)}{(1-t^2)^2} \cdot \frac{1}{(1+\tan^2 y)} = \frac{2(1+t^2)}{(1-t^2)^2} \cdot \frac{1}{1+\frac{4t^2}{(1-t^2)^2}} \\ & = \frac{2(1+t^2)}{(1-t^2)^2} \cdot \frac{(1-t^2)^2}{(1+t^2)^2} = \frac{2}{1+t^2} \quad \dots(iv) \end{aligned}$$

$$\therefore \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{2/1+t^2}{2/1+t^2} = 1 \quad [\text{from Eqs. (iii) and (iv)}]$$

$$\text{Q. 48} x = \frac{1+\log t}{t^2}, y = \frac{3+2\log t}{t}$$

$$\text{Sol.} \because x = \frac{1+\log t}{t^2} \text{ and } y = \frac{3+2\log t}{t}$$

$$\therefore \frac{dx}{dt} = \frac{t^2 \cdot \frac{d}{dt}(1+\log t) - (1+\log t) \cdot \frac{d}{dt}t^2}{(t^2)^2}$$

$$\begin{aligned}
&= \frac{t^2 \cdot \frac{1}{t} - (1 + \log t) \cdot 2t}{t^4} = \frac{t - (1 + \log t) \cdot 2t}{t^4} \\
&= \frac{t}{t^4} [1 - 2(1 + \log t)] = \frac{-1 - 2 \log t}{t^3} \quad \dots (\text{i}) \\
\text{and } &\frac{dy}{dt} = \frac{t \cdot \frac{d}{dt}(3 + 2 \log t) - (3 + 2 \log t) \cdot \frac{d}{dt} t}{t^2} \\
&= \frac{t \cdot 2 \cdot \frac{1}{t} - (3 + 2 \log t) \cdot 1}{t^2} \\
&= \frac{2 - 3 - 2 \log t}{t^2} = \frac{-1 - 2 \log t}{t^2} \quad \dots (\text{ii}) \\
\therefore &\frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{-1 - 2 \log t / t^2}{-1 - 2 \log t / t^3} = t
\end{aligned}$$

Q. 49 If $x = e^{\cos 2t}$ and $y = e^{\sin 2t}$, then prove that $\frac{dy}{dx} = -\frac{y \log x}{x \log y}$.

Sol. ∵

$$\begin{aligned}
&x = e^{\cos 2t} \text{ and } y = e^{\sin 2t} \\
\therefore &\frac{dx}{dt} = \frac{d}{dt} e^{\cos 2t} = e^{\cos 2t} \cdot \frac{d}{dt} \cos 2t \\
&= e^{\cos 2t} \cdot (-\sin 2t) \cdot \frac{d}{dt} (2t) \\
&= -2e^{\cos 2t} \cdot \sin 2t \quad \dots (\text{i}) \\
\text{and } &\frac{dy}{dt} = \frac{d}{dt} e^{\sin 2t} = e^{\sin 2t} \cdot \frac{d}{dt} \sin 2t \\
&= e^{\sin 2t} \cos 2t \cdot \frac{d}{dt} 2t \\
&= 2e^{\sin 2t} \cdot \cos 2t \quad \dots (\text{ii}) \\
\therefore &\frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{2e^{\sin 2t} \cdot \cos 2t}{-2e^{\cos 2t} \cdot \sin 2t} \\
&= \frac{e^{\sin 2t} \cdot \cos 2t}{e^{\cos 2t} \cdot \sin 2t} \quad \dots (\text{iii})
\end{aligned}$$

We know that,

$$\log x = \cos 2t \cdot \log e = \cos 2t \quad \dots (\text{iv})$$

and

$$\log y = \sin 2t \cdot \log e = \sin 2t \quad \dots (\text{v})$$

$$\therefore \frac{dy}{dx} = \frac{-y \log x}{x \log y}$$

[using Eqs. (iv) and (v) in Eq. (iii) and $x = e^{\cos 2t}$, $y = e^{\sin 2t}$]

Hence proved.

Q. 50 If $x = a \sin 2t (1 + \cos 2t)$ and $y = b \cos 2t (1 - \cos 2t)$, then show that

$$\left(\frac{dy}{dx} \right)_{t=\pi/4} = \frac{b}{a}.$$

Sol. ∵

$$\begin{aligned}
&x = a \sin 2t (1 + \cos 2t) \text{ and } y = b \cos 2t (1 - \cos 2t) \\
\therefore &\frac{dx}{dt} = a \left[\sin 2t \cdot \frac{d}{dt} (1 + \cos 2t) + (1 + \cos 2t) \cdot \frac{d}{dt} \sin 2t \right]
\end{aligned}$$

$$\begin{aligned}
&= a \left[\sin 2t \cdot (-\sin 2t) \cdot \frac{d}{dt} 2t + (1 + \cos 2t) \cdot \cos 2t \cdot \frac{d}{dt} 2t \right] \\
&= -2a \sin^2 2t + 2a \cos 2t (1 + \cos 2t) \\
\Rightarrow \quad \frac{dx}{dt} &= -2a [\sin^2 2t - \cos 2t (1 + \cos 2t)] \quad \dots(i) \\
\text{and} \quad \frac{dy}{dt} &= b \left[\cos 2t \cdot \frac{d}{dt} (1 - \cos 2t) + (1 - \cos 2t) \cdot \frac{d}{dt} \cos 2t \right] \\
&= b \left[\cos 2t \cdot (\sin 2t) \frac{d}{dt} 2t + (1 - \cos 2t) (-\sin 2t) \cdot \frac{d}{dt} 2t \right] \\
&= b [2 \sin 2t \cdot \cos 2t + 2 (1 - \cos 2t) (-\sin 2t)] \\
&= 2b [\sin 2t \cdot \cos 2t - (1 - \cos 2t) \sin 2t] \quad \dots(ii) \\
\therefore \quad \frac{dy}{dx} &= \frac{dy/dt}{dx/dt} = \frac{-2b [-\sin 2t \cdot \cos 2t + (1 - \cos 2t) \sin 2t]}{-2a [\sin^2 2t - \cos 2t (1 + \cos 2t)]} \\
\Rightarrow \quad \left(\frac{dy}{dx} \right)_{t=\pi/4} &= \frac{b}{a} \frac{\left[-\sin \frac{\pi}{2} \cos \frac{\pi}{2} + \left(1 - \cos \frac{\pi}{2}\right) \sin \frac{\pi}{2} \right]}{\left[\sin^2 \frac{\pi}{2} - \cos \frac{\pi}{2} \left(1 + \cos \frac{\pi}{2}\right) \right]} \\
&= \frac{b}{a} \cdot \frac{(0+1)}{(1-0)} \quad \left[\because \sin \frac{\pi}{2} = 1 \text{ and } \cos \frac{\pi}{2} = 0 \right] \\
&= \frac{b}{a} \quad \text{Hence proved.}
\end{aligned}$$

Q. 51 If $x = 3 \sin t - \sin 3t$, $y = 3 \cos t - \cos 3t$, then find $\frac{dy}{dx}$ at $t = \frac{\pi}{3}$.

Sol. $\because x = 3 \sin t - \sin 3t$ and $y = 3 \cos t - \cos 3t$

$$\begin{aligned}
\therefore \quad \frac{dx}{dt} &= 3 \cdot \frac{d}{dt} \sin t - \frac{d}{dt} \sin 3t \\
&= 3 \cos t - \cos 3t \cdot \frac{d}{dt} 3t = 3 \cos t - 3 \cos 3t \quad \dots(i)
\end{aligned}$$

and

$$\begin{aligned}
\frac{dy}{dt} &= 3 \cdot \frac{d}{dt} \cos t - \frac{d}{dt} \cos 3t \\
&= -3 \sin t + \sin 3t \cdot \frac{d}{dt} 3t \\
&= 3 \sin 3t - 3t \sin t \quad \dots(ii)
\end{aligned}$$

$$\therefore \quad \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{3(\sin 3t - \sin t)}{3(\cos t - \cos 3t)}$$

Now,

$$\begin{aligned}
\left(\frac{dy}{dx} \right)_{t=\pi/3} &= \frac{\sin \frac{3\pi}{3} - \sin \frac{\pi}{3}}{\left(\cos \frac{\pi}{3} - \cos 3 \frac{\pi}{3} \right)} = \frac{0 - \sqrt{3}/2}{\frac{1}{2} - (-1)} \\
&= \frac{-\sqrt{3}/2}{3/2} = \frac{-\sqrt{3}}{3} = \frac{-1}{\sqrt{3}}
\end{aligned}$$

Q. 52 Differentiate $\frac{x}{\sin x}$ w.r.t. $\sin x$.

Sol. Let

$$u = \frac{x}{\sin x} \text{ and } v = \sin x$$

∴

$$\begin{aligned}\frac{du}{dx} &= \frac{\sin x \cdot \frac{d}{dx} x - x \cdot \frac{d}{dx} \sin x}{(\sin x)^2} \\ &= \frac{\sin x - x \cos x}{\sin^2 x}\end{aligned}\quad \dots(i)$$

and

$$\frac{dv}{dx} = \frac{d}{dx} \sin x = \cos x \quad \dots(ii)$$

∴

$$\begin{aligned}\frac{du}{dv} &= \frac{du/dx}{dv/dx} = \frac{\sin x - x \cos x / \sin^2 x}{\cos x} \\ &= \frac{\sin x - x \cos x}{\sin^2 x \cos x} = \frac{\sin x - x \cos x}{\frac{\cos x}{\sin^2 x \cos x}}\end{aligned}$$

$$\begin{aligned}&\quad [\text{dividing by } \cos x \text{ in both numerator and denominator}] \\ &= \frac{\tan x - x}{\sin^2 x}\end{aligned}$$

Q. 53 Differentiate $\tan^{-1} \frac{\sqrt{1+x^2} - 1}{x}$ w.r.t. $\tan^{-1} x$, when $x \neq 0$.

Sol. Let

$$u = \tan^{-1} \frac{\sqrt{1+x^2} - 1}{x} \text{ and } v = \tan^{-1} x$$

∴

$$\begin{aligned}u &= \tan^{-1} \frac{\sqrt{1+\tan^2 \theta} - 1}{\tan \theta} \\ &= \tan^{-1} \frac{(\sec \theta - 1) \cos \theta}{\sin \theta}\end{aligned}$$

$$\begin{aligned}&= \tan^{-1} \left(\frac{1 - \cos \theta}{\sin \theta} \right) \\ &= \tan^{-1} \left[\frac{1 - 1 + 2\sin^2 \theta/2}{2\sin\theta/2 \cdot \cos\theta/2} \right] \quad [∵ \cos\theta = 1 - 2\sin^2 \theta]\end{aligned}$$

$$= \tan^{-1} \left[\frac{\tan \frac{\theta}{2}}{\frac{1}{2}} \right]$$

$$= \frac{\theta}{2} = \frac{1}{2} \tan^{-1} x$$

∴

$$\frac{du}{dx} = \frac{1}{2} \frac{d}{dx} \tan^{-1} x = \frac{1}{2} \cdot \frac{1}{1+x^2} \quad \dots(i)$$

and

$$\frac{dv}{dx} = \frac{d}{dx} \tan^{-1} x = \frac{1}{1+x^2} \quad \dots(ii)$$

∴

$$\begin{aligned}\frac{du}{dv} &= \frac{du/dx}{dv/dx} \\ &= \frac{1/2 (1+x^2)}{1/(1+x^2)} = \frac{(1+x^2)}{2(1+x^2)} = \frac{1}{2}\end{aligned}$$

Find $\frac{dy}{dx}$ when x and y are connected by the relation given.

Q. 54 $\sin(xy) + \frac{x}{y} = x^2 - y$

Sol. We have,

$$\sin(xy) + \frac{x}{y} = x^2 - y$$

On differentiating both sides w.r.t. x , we get

$$\begin{aligned} & \frac{d}{dx}(\sin(xy)) + \frac{d}{dx}\left(\frac{x}{y}\right) = \frac{d}{dx}x^2 - \frac{d}{dx}y \\ \Rightarrow & \cos xy \cdot \frac{d}{dx}(xy) + \frac{y \frac{d}{dx}x - x \cdot \frac{d}{dx}y}{y^2} = 2x - \frac{dy}{dx} \\ \Rightarrow & \cos xy \cdot \left[x \cdot \frac{d}{dx}y + y \cdot \frac{d}{dx}x \right] + \frac{y - x \frac{dy}{dx}}{y^2} = 2x - \frac{dy}{dx} \\ \Rightarrow & x \cos xy \cdot \frac{dy}{dx} + y \cos xy + \frac{y}{y^2} - \frac{x}{y^2} \frac{dy}{dx} = 2x - \frac{dy}{dx} \\ \Rightarrow & \frac{dy}{dx} \left[x \cos xy - \frac{x}{y^2} + 1 \right] = 2x - y \cos xy - \frac{y}{y^2} \\ \therefore & \frac{dy}{dx} = \left[\frac{2xy - y^2 \cos xy - 1}{y} \right] \left[\frac{y^2}{xy^2 \cos xy - x + y^2} \right] \\ & = \frac{(2xy - y^2 \cos xy - 1)y}{(xy^2 \cos xy - x + y^2)} \end{aligned}$$

Q. 55 $\sec(x + y) = xy$

Sol. We have, $\sec(x + y) = xy$

On differentiating both sides w.r.t. x , we get

$$\begin{aligned} & \frac{d}{dx} \sec(x + y) = \frac{d}{dx}(xy) \\ \Rightarrow & \sec(x + y) \cdot \tan(x + y) \cdot \frac{d}{dx}(x + y) = x \cdot \frac{d}{dx}y + y \cdot \frac{d}{dx}x \\ \Rightarrow & \sec(x + y) \cdot \tan(x + y) \cdot \left(1 + \frac{dy}{dx}\right) = x \frac{dy}{dx} + y \\ \Rightarrow & \sec(x + y) \tan(x + y) + \sec(x + y) \cdot \tan(x + y) \cdot \frac{dy}{dx} = x \frac{dy}{dx} + y \\ \Rightarrow & \frac{dy}{dx} [\sec(x + y) \cdot \tan(x + y) - x] = y - \sec(x + y) \cdot \tan(x + y) \\ \therefore & \frac{dy}{dx} = \frac{y - \sec(x + y) \cdot \tan(x + y)}{\sec(x + y) \cdot \tan(x + y) - x} \end{aligned}$$

Q. 56 $\tan^{-1}(x^2 + y^2) = a$

Sol. We have, $\tan^{-1}(x^2 + y^2) = a$

On differentiating both sides w.r.t. x , we get

$$\begin{aligned} & \frac{d}{dx} \tan^{-1}(x^2 + y^2) = \frac{d}{dx}(a) \\ \Rightarrow & \frac{1}{1 + (x^2 + y^2)^2} \cdot \frac{d}{dx}(x^2 + y^2) = 0 \\ \Rightarrow & 2x + \frac{d}{dy} y^2 \cdot \frac{dy}{dx} = 0 \\ \Rightarrow & 2y \cdot \frac{dy}{dx} = -2x \\ \therefore & \frac{dy}{dx} = \frac{-2x}{2y} = \frac{-x}{y} \end{aligned}$$

Q. 57 $(x^2 + y^2)^2 = xy$

Sol. We have, $(x^2 + y^2)^2 = xy$

On differentiating both sides w.r.t. x , we get

$$\begin{aligned} & \frac{d}{dx}(x^2 + y^2)^2 = \frac{d}{dx}(xy) \\ \Rightarrow & 2(x^2 + y^2) \cdot \frac{d}{dx}(x^2 + y^2) = x \cdot \frac{d}{dx}y + y \cdot \frac{d}{dx}x \\ \Rightarrow & 2(x^2 + y^2) \cdot \left(2x + 2y \frac{dy}{dx}\right) = x \frac{dy}{dx} + y \\ \Rightarrow & 2x^2 \cdot 2x + 2x^2 \cdot 2y \frac{dy}{dx} + 2y^2 \cdot 2x + 2y^2 \cdot 2y \frac{dy}{dx} = x \frac{dy}{dx} + y \\ \Rightarrow & \frac{dy}{dx} [4x^2y + 4y^3 - x] = y - 4x^3 - 4xy^2 \\ \therefore & \frac{dy}{dx} = \frac{(y - 4x^3 - 4xy^2)}{(4x^2y + 4y^3 - x)} \end{aligned}$$

Q. 58 If $ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0$, then show that $\frac{dy}{dx} \cdot \frac{dx}{dy} = 1$.

Sol. We have, $ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0$... (i)

On differentiating both sides w.r.t. x , we get

$$\begin{aligned} & \frac{d}{dx}(ax^2) + \frac{d}{dx}(2hxy) + \frac{d}{dx}(by^2) + \frac{d}{dx}(2gx) + \frac{d}{dx}(2fy) + \frac{d}{dx}(c) = 0 \\ \Rightarrow & 2ax + 2h \left(x \cdot \frac{dy}{dx} + y \cdot 1 \right) + b \cdot 2y \frac{dy}{dx} + 2g + 2f \frac{dy}{dx} + 0 = 0 \\ \Rightarrow & \frac{dy}{dx} [2hx + 2by + 2f] = -2ax - 2hy - 2g \\ \Rightarrow & \frac{dy}{dx} = \frac{-2(ax + hy + g)}{2(hx + by + f)} \\ & = \frac{-(ax + hy + g)}{(hx + by + f)} \quad \dots \text{(ii)} \end{aligned}$$

Now, differentiating Eq. (i) w.r.t. y , we get

$$\begin{aligned} & \frac{d}{dy}(ax^2) + \frac{d}{dy}(2hxy) + \frac{d}{dy}(by^2) + \frac{d}{dy}(2gx) + \frac{d}{dy}(2fy) + \frac{d}{dy}(c) = 0 \\ \Rightarrow & a \cdot 2x \cdot \frac{dx}{dy} + 2h \cdot \left(x \cdot \frac{d}{dy}y + y \cdot \frac{d}{dy}x \right) + b \cdot 2y + 2g \cdot \frac{dx}{dy} + 2f + 0 = 0 \\ \Rightarrow & \frac{dx}{dy}[2ax + 2hy + 2g] = -2hx - 2by - 2f \\ \Rightarrow & \frac{dx}{dy} = \frac{-2(hx + by + f)}{2(ax + hy + g)} = \frac{-(hx + by + f)}{(ax + hy + g)} \quad \dots (\text{iii}) \\ \therefore & \frac{dy}{dx} \cdot \frac{dx}{dy} = \frac{-(ax + hy + g)}{(hx + by + f)} \cdot \frac{-(hx + by + f)}{(ax + hy + g)} \quad [\text{using Eqs. (ii) and (iii)}] \\ & = 1 = \text{RHS} \end{aligned}$$

Hence proved.

Q. 59 If $x = e^{x/y}$, then prove that $\frac{dy}{dx} = \frac{x-y}{x \log x}$.

Sol. We have,

$$\begin{aligned} & x = e^{x/y} \\ \therefore & \frac{d}{dx}x = \frac{d}{dx}e^{x/y} \\ \Rightarrow & 1 = e^{x/y} \cdot \frac{d}{dx}(x/y) \\ \Rightarrow & 1 = e^{x/y} \cdot \left[\frac{y \cdot 1 - x \cdot dy/dx}{y^2} \right] \\ \Rightarrow & y^2 = y \cdot e^{x/y} - x \cdot \frac{dy}{dx} \cdot e^{x/y} \\ \Rightarrow & x \cdot \frac{dy}{dx} \cdot e^{x/y} = ye^{x/y} - y^2 \\ \therefore & \frac{dy}{dx} = \frac{y(e^{x/y} - y)}{x \cdot e^{x/y}} \\ & = \frac{(e^{x/y} - y)}{e^{x/y} \cdot \frac{x}{y}} \quad \left[\because x = e^{x/y} \Rightarrow \log x = \frac{x}{y} \right] \\ & = \frac{x - y}{x \cdot \log x} \end{aligned}$$

Hence proved.

Q. 60 If $y^x = e^{y-x}$, then prove that $\frac{dy}{dx} = \frac{(1 + \log y)^2}{\log y}$.

Sol. We have,

$$\begin{aligned} & y^x = e^{y-x} \\ \Rightarrow & \log y^x = \log e^{y-x} \\ \Rightarrow & x \log y = y - x \cdot \log_e = (y - x) \quad [\because \log_e = 1] \\ \Rightarrow & \log y = \frac{(y - x)}{x} \quad \dots (\text{i}) \end{aligned}$$

Now, differentiating w.r.t. x , we get

$$\frac{d}{dy} \log y \cdot \frac{dy}{dx} = \frac{d}{dx} \frac{(y - x)}{x}$$

$$\begin{aligned}
&\Rightarrow \frac{1}{y} \cdot \frac{dy}{dx} = \frac{x \cdot \frac{d}{dx}(y-x) - (y-x) \cdot \frac{d}{dx} \cdot x}{x^2} \\
&\Rightarrow \frac{1}{y} \frac{dy}{dx} = \frac{x \left(\frac{dy}{dx} - 1 \right) - (y-x)}{x^2} \\
&\Rightarrow \frac{x^2}{y} \cdot \frac{dy}{dx} = x \frac{dy}{dx} - x - y + x \\
&\Rightarrow \frac{dy}{dx} \left(\frac{x^2}{y} - x \right) = -y \\
&\therefore \frac{dy}{dx} = \frac{-y^2}{x^2 - xy} = \frac{-y^2}{x(x-y)} \\
&= \frac{y^2}{x(y-x)} \cdot \frac{x}{x} = \frac{y^2}{x^2} \cdot \frac{1}{\frac{x}{y-x}} \\
&= \frac{(1 + \log y)^2}{\log y} \quad \left[\because \log y = \frac{y-x}{x} \quad \log y = \frac{y}{x} - 1 \Rightarrow 1 + \log y = \frac{y}{x} \right]
\end{aligned}$$

Hence proved.

Q. 61 If $y = (\cos x)^{(\cos x)^{(\cos x)^{\dots^\infty}}}$, then show that $\frac{dy}{dx} = \frac{y^2 \tan x}{y \log \cos x - 1}$.

Sol. We have,

$$\begin{aligned}
&y = (\cos x)^{(\cos x)^{(\cos x)^{\dots^\infty}}} \\
&\Rightarrow y = (\cos x)^y \\
&\therefore \log y = \log (\cos x)^y \\
&\Rightarrow \log y = y \log \cos x
\end{aligned}$$

On differentiating w.r.t. x , we get

$$\begin{aligned}
&\frac{1}{y} \cdot \frac{dy}{dx} = y \cdot \frac{d}{dx} \log \cos x + \log \cos x \cdot \frac{dy}{dx} \\
&\Rightarrow \frac{1}{y} \cdot \frac{dy}{dx} = \frac{y}{\cos x} \cdot \frac{d}{dx} \cos x + \log \cos x \cdot \frac{dy}{dx} \\
&\Rightarrow \frac{dy}{dx} \left[\frac{1}{y} - \log \cos x \right] = \frac{-ysinx}{\cos x} = -ytanx \\
&\therefore \frac{dy}{dx} = \frac{-y^2 \tan x}{(1 - y \log \cos x)} \\
&= \frac{y^2 \tan x}{y \log \cos x - 1}
\end{aligned}$$

Hence proved.

Q. 62 If $x \sin(a+y) + \sin a \cdot \cos(a+y) = 0$, then prove that

$$\frac{dy}{dx} = \frac{\sin^2(a+y)}{\sin a}.$$

Sol. We have,

$$\begin{aligned}
&x \sin(a+y) + \sin a \cdot \cos(a+y) = 0 \\
&\Rightarrow x \sin(a+y) = -\sin a \cdot \cos(a+y) \\
&\Rightarrow x = \frac{-\sin a \cdot \cos(a+y)}{\sin(a+y)}
\end{aligned}$$

$$\begin{aligned}
\Rightarrow & \quad x = -\sin a \cdot \cot(a + y) \\
\therefore & \quad \frac{dx}{dy} = -\sin a \cdot [-\operatorname{cosec}^2(a + y)] \cdot \frac{d}{dy}(a + y) \\
& = \sin a \cdot \frac{1}{\sin^2(a + y)} \cdot 1 \\
& = \frac{\sin^2(a + y)}{\sin a} \quad \text{Hence proved.}
\end{aligned}$$

Q. 63 If $\sqrt{1-x^2} + \sqrt{1-y^2} = a(x-y)$, then prove that $\frac{dy}{dx} = \sqrt{\frac{1-y^2}{1-x^2}}$.

Sol. We have,

$$\sqrt{1-x^2} + \sqrt{1-y^2} = a(x-y)$$

On putting $x = \sin \alpha$ and $y = \sin \beta$, we get

$$\begin{aligned}
& \sqrt{1-\sin^2 \alpha} + \sqrt{1-\sin^2 \beta} = a(\sin \alpha - \sin \beta) \\
\Rightarrow & \quad \cos \alpha + \cos \beta = a(\sin \alpha - \sin \beta) \\
\Rightarrow & \quad 2\cos \frac{\alpha+\beta}{2} \cdot \cos \frac{\alpha-\beta}{2} = a \left(2\cos \frac{\alpha+\beta}{2} \cdot \sin \frac{\alpha-\beta}{2} \right) \\
\Rightarrow & \quad \cos \frac{\alpha-\beta}{2} = a \sin \frac{\alpha-\beta}{2} \\
\Rightarrow & \quad \cot \frac{\alpha-\beta}{2} = a \\
\Rightarrow & \quad \frac{\alpha-\beta}{2} = \cot^{-1} a \\
\Rightarrow & \quad \alpha-\beta = 2\cot^{-1} a \\
\Rightarrow & \quad \sin^{-1} x - \sin^{-1} y = 2\cot^{-1} a \quad [\because x = \sin \alpha \text{ and } y = \sin \beta]
\end{aligned}$$

On differentiating both sides w.r.t. x , we get

$$\begin{aligned}
& \frac{1}{\sqrt{1-x^2}} - \frac{1}{\sqrt{1-y^2}} \frac{dy}{dx} = 0 \\
\therefore & \quad \frac{dy}{dx} = \frac{\sqrt{1-y^2}}{\sqrt{1-x^2}} = \sqrt{\frac{1-y^2}{1-x^2}} \quad \text{Hence proved.}
\end{aligned}$$

Q. 64 If $y = \tan^{-1} x$, then find $\frac{d^2y}{dx^2}$ in terms of y alone.

Sol. We have,

$$\begin{aligned}
y &= \tan^{-1} x && \text{[on differentiating w.r.t. } x] \\
\therefore & \quad \frac{dy}{dx} = \frac{1}{1+x^2} && \text{[again differentiating w.r.t. } x]
\end{aligned}$$

Now,

$$\begin{aligned}
\frac{d^2y}{dx^2} &= \frac{d}{dx}(1+x^2)^{-1} \\
&= -1(1+x^2)^{-2} \cdot \frac{d}{dx}(1+x^2) \\
&= -\frac{1}{(1+x^2)^2} \cdot 2x \\
&= \frac{-2\tan y}{(1+\tan^2 y)^2} \quad [\because y = \tan^{-1} x \Rightarrow \tan y = x]
\end{aligned}$$

$$\begin{aligned}
&= \frac{-2\tan y}{(\sec^2 y)^2} \\
&= -2 \frac{\sin y}{\cos y} \cdot \cos^2 y \cdot \cos^2 y \\
&= -\sin 2x \cdot \cos^2 y \quad [\because \sin 2x = 2\sin x \cos x]
\end{aligned}$$

Verify the Rolle's theorem for each of the functions in following questions.

Q. 65 $f(x) = x(x - 1)^2$ in $[0, 1]$

💡 Thinking Process

We know that, Rolle's theorem states that, if f be a real valued function, defined in the closed interval $[a, b]$, such that (i) f is continuous on $[a, b]$. (ii) f is differentiable on (a, b) . (iii) $f(a) = f(b)$.

Then, there exists a real number c in the open interval (a, b) , such that $f'(c) = 0$. Here, we shall verify the Rolle's theorem for the given function.

Sol. We have, $f(x) = x(x - 1)^2$ in $[0, 1]$.

(i) Since, $f(x) = x(x - 1)^2$ is a polynomial function.

So, it is continuous in $[0, 1]$.

(ii) Now,

$$\begin{aligned}
f'(x) &= x \cdot \frac{d}{dx}(x - 1)^2 + (x - 1)^2 \cdot \frac{d}{dx}x \\
&= x \cdot 2(x - 1) \cdot 1 + (x - 1)^2 \\
&= 2x^2 - 2x + x^2 + 1 - 2x \\
&= 3x^2 - 4x + 1 \text{ which exists in } (0, 1).
\end{aligned}$$

So, $f(x)$ is differentiable in $(0, 1)$.

(iii) Now, $f(0) = 0$ and $f(1) = 0 \Rightarrow f(0) = f(1)$

f satisfies the above conditions of Rolle's theorem.

Hence, by Rolle's theorem $\exists c \in (0, 1)$ such that

$$\begin{aligned}
&f'(c) = 0 \\
\Rightarrow &3c^2 - 4c + 1 = 0 \\
\Rightarrow &3c^2 - 3c - c + 1 = 0 \\
\Rightarrow &3c(c - 1) - 1(c - 1) = 0 \\
\Rightarrow &(3c - 1)(c - 1) = 0 \\
\Rightarrow &c = \frac{1}{3}, 1 \Rightarrow \frac{1}{3} \in (0, 1)
\end{aligned}$$

Thus, we see that there exists a real number c in the open interval $(0, 1)$.

Hence, Rolle's theorem has been verified.

Q. 66 $f(x) = \sin^4 x + \cos^4 x$ in $\left[0, \frac{\pi}{2}\right]$

Sol. We have, $f(x) = \sin^4 x + \cos^4 x$ in $\left[0, \frac{\pi}{2}\right]$... (i)

(i) $f(x)$ is continuous in $\left[0, \frac{\pi}{2}\right]$

[since, $\sin^4 x$ and $\cos^4 x$ are continuous functions and we know that, if g and h be continuous functions, then $(g + h)$ is a continuous function.]

(ii)
$$\begin{aligned} f'(x) &= 4(\sin x)^3 \cdot \cos x + 4(\cos x)^3 \cdot (-\sin x) \\ &= 4\sin^3 x \cdot \cos x - 4\sin x \cdot \cos^3 x \\ &= 4\sin x \cos x (\sin^2 x - \cos^2 x) \text{ which exists in } \left(0, \frac{\pi}{2}\right) \end{aligned}$$
 ... (ii)

Hence, $f(x)$ is differentiable in $\left(0, \frac{\pi}{2}\right)$.

(iii) Also, $f(0) = 0 + 1 = 1$ and $f\left(\frac{\pi}{2}\right) = 1 + 0 = 1$

$$\Rightarrow f(0) = f\left(\frac{\pi}{2}\right)$$

Conditions of Rolle's theorem are satisfied.

Hence, there exists atleast one $c \in \left(0, \frac{\pi}{2}\right)$ such that $f'(c) = 0$.

$$\therefore 4\sin c \cos c (\sin^2 c - \cos^2 c) = 0$$

$$\Rightarrow 4\sin c \cos c (-\cos 2c) = 0$$

$$\Rightarrow -2\sin 2c \cdot \cos 2c = 0$$

$$\Rightarrow -\sin 4c = 0$$

$$\Rightarrow \sin 4c = 0$$

$$\Rightarrow 4c = \pi$$

$$\Rightarrow c = \frac{\pi}{4}$$

$$\text{and } \frac{\pi}{4} \in \left(0, \frac{\pi}{2}\right)$$

Hence, Rolle's theorem has been verified.

Q. 67 $f(x) = \log(x^2 + 2) - \log 3$ in $[-1, 1]$

Sol. We have, $f(x) = \log(x^2 + 2) - \log 3$.

(i) Logarithmic functions are continuous in their domain.

Hence, $f(x) = \log(x^2 + 2) - \log 3$ is continuous in $[-1, 1]$.

(ii)
$$\begin{aligned} f'(x) &= \frac{1}{x^2 + 2} \cdot 2x - 0 \\ &= \frac{2x}{x^2 + 2}, \text{ which exists in } (-1, 1). \end{aligned}$$

Hence, $f(x)$ is differentiable in $(-1, 1)$.

(iii) $f(-1) = \log [(-1)^2 + 2] - \log 3 = \log 3 - \log 3 = 0$ and

$$f(1) = \log (1^2 + 2) - \log 3 = \log 3 - \log 3 = 0$$

$$\Rightarrow f(-1) = f(1)$$

Conditions of Rolle's theorem are satisfied.

Hence, there exists a real number c such that

$$\Rightarrow f'(c) = 0.$$

$$\Rightarrow \frac{2c}{c^2 + 2} = 0$$

$$\Rightarrow c = 0 \in (-1, 1)$$

Hence, Rolle's theorem has been verified.

Q. 68 $f(x) = x(x+3)e^{-x/2}$ in $[-3, 0]$

Sol. We have, $f(x) = x(x+3)e^{-x/2}$

(i) $f(x)$ is a continuous function. [since, it is a combination of polynomial functions $x(x+3)$ and an exponential function $e^{-x/2}$ which are continuous functions]

So, $f(x) = x(x+3)e^{-x/2}$ is continuous in $[-3, 0]$.

$$\begin{aligned} \text{(ii)} \therefore f'(x) &= (x^2 + 3x) \cdot \frac{d}{dx} e^{-x/2} + e^{-x/2} \cdot \frac{d}{dx} (x^2 + 3x) \\ &= (x^2 + 3x) \cdot e^{-x/2} \cdot \left(-\frac{1}{2}\right) + e^{-x/2} \cdot (2x + 3) \\ &= e^{-x/2} \left[2x + 3 - \frac{1}{2} \cdot (x^2 + 3x)\right] \\ &= e^{-x/2} \left[\frac{4x + 6 - x^2 - 3x}{2}\right] \\ &= e^{-x/2} \cdot \frac{1}{2} [-x^2 + x + 6] \\ &= \frac{-1}{2} e^{-x/2} [x^2 - x - 6] \\ &= \frac{-1}{2} e^{-x/2} [x^2 - 3x + 2x - 6] \\ &= \frac{-1}{2} e^{-x/2} [(x+2)(x-3)] \text{ which exists in } (-3, 0). \end{aligned}$$

Hence, $f(x)$ is differentiable in $(-3, 0)$.

(iii) $\therefore f(-3) = -3(-3+3)e^{-3/2} = 0$

and $f(0) = 0(0+3)e^{-0/2} = 0$

$$\Rightarrow f(-3) = f(0)$$

Since, conditions of Rolle's theorem are satisfied.

Hence, there exists a real number c such that $f'(c) = 0$

$$\Rightarrow -\frac{1}{2} e^{-c/2} (c+2)(c-3) = 0$$

$$\Rightarrow c = -2, 3, \text{ where } -2 \in (-3, 0)$$

Therefore, Rolle's theorem has been verified.

Q. 69 $f(x) = \sqrt{4 - x^2}$ in $[-2, 2]$

Sol. We have, $f(x) = \sqrt{4 - x^2} = (4 - x^2)^{1/2}$

(i) $f(x) = \sqrt{4 - x^2}$ is a continuous function.

[since every polynomial function is a continuous function]

Hence, $f(x)$ is continuous in $[-2, 2]$.

$$(ii) f'(x) = \frac{1}{2} (4 - x^2)^{-1/2} \cdot (-2x)$$

$$= -x \cdot \frac{1}{\sqrt{4 - x^2}}, \text{ which exists everywhere except at } x = \pm 2.$$

Hence, $f(x)$ is differentiable in $(-2, 2)$.

$$(iii) f(-2) = \sqrt{(4 - 4)} = 0 \text{ and } f(2) = \sqrt{(4 - 4)} = 0$$

$$\Rightarrow f(-2) = f(2)$$

conditions of Rolle's theorem are satisfied.

Hence, there exists a real number c such that $f'(c) = 0$.

$$\Rightarrow -c \cdot \frac{1}{\sqrt{4 - c^2}} = 0$$

$$\Rightarrow c = 0 \in (-2, 2)$$

Hence, Rolle's theorem has been verified.

Q. 70 Discuss the applicability of Rolle's theorem on the function given by

$$f(x) = \begin{cases} x^2 + 1, & \text{if } 0 \leq x \leq 1 \\ 3 - x, & \text{if } 1 \leq x \leq 2 \end{cases}$$

Sol. We have,

$$f(x) = \begin{cases} x^2 + 1, & \text{if } 0 \leq x \leq 1 \\ 3 - x, & \text{if } 1 \leq x \leq 2 \end{cases}$$

We know that, polynomial function is everywhere continuous and differentiability.

So, $f(x)$ is continuous and differentiable at all points except possibly at $x = 1$.

Now, check the differentiability at $x = 1$,

At $x = 1$,

$$\begin{aligned} \text{LDH} &= \lim_{x \rightarrow 1^-} \frac{f(x) - f(1)}{x - 1} \\ &= \lim_{x \rightarrow 1} \frac{(x^2 + 1) - (1 + 1)}{x - 1} \quad [\because f(x) = x^2 + 1, \forall 0 \leq x \leq 1] \\ &= \lim_{x \rightarrow 1} \frac{x^2 - 1}{x - 1} = \lim_{x \rightarrow 1} \frac{(x + 1)(x - 1)}{x - 1} \\ &\quad = 2 \end{aligned}$$

and

$$\begin{aligned} \text{RHD} &= \lim_{x \rightarrow 1^+} \frac{f(x) - f(1)}{x - 1} = \lim_{x \rightarrow 1} \frac{(3 - x) - (1 + 1)}{(x - 1)} \\ &= \lim_{x \rightarrow 1} \frac{3 - x - 2}{x - 1} = \lim_{x \rightarrow 1} \frac{-(x - 1)}{x - 1} = -1 \end{aligned}$$

$\therefore \text{LHD} \neq \text{RHD}$

So, $f(x)$ is not differentiable at $x = 1$.

Hence, polle's theorem is not applicable on the interval $[0, 2]$.

Q. 71 Find the points on the curve $y = (\cos x - 1)$ in $[0, 2\pi]$, where the tangent is parallel to X-axis.

Thinking Process

We know that, if f be a real valued function defined in the closed interval $[a, b]$ such that it follows all the three conditions of Rolle's theorem, then $f'(c) = 0$ shows that the tangent to the curve at $x = c$ has a slope 0, i.e., it is parallel to the X-axis. So, by getting the value of c' we can get the required point.

Sol. The equation of the curve is $y = \cos x - 1$.

Now, we have to find a point on the curve in $[0, 2\pi]$,

where the tangent is parallel to X-axis i.e., the tangent to the curve at $x = c$ has a slope 0, where $c \in [0, 2\pi[$.

Let us apply Rolle's theorem to get the point.

(i) $y = \cos x - 1$ is a continuous function in $[0, 2\pi]$.

[since it is a combination of cosine function and a constant function]

(ii) $y' = -\sin x$, which exists in $(0, 2\pi)$.

Hence, y is differentiable in $(0, 2\pi)$.

(iii) $y(0) = \cos 0 - 1 = 0$ and $y(2\pi) = \cos 2\pi - 1 = 0$,

$$\therefore y(0) = y(2\pi)$$

Since, conditions of Rolle's theorem are satisfied.

Hence, there exists a real number c such that

$$f'(c) = 0$$

$$\Rightarrow -\sin c = 0$$

$$\Rightarrow c = \pi \text{ or } 0, \text{ where } \pi \in (0, 2\pi)$$

$$\Rightarrow x = \pi$$

$$\therefore y = \cos \pi - 1 = -2$$

Hence, the required point on the curve, where the tangent drawn is parallel to the X-axis is $(\pi, -2)$.

Q. 72 Using Rolle's theorem, find the point on the curve $y = x(x - 4)$, $x \in [0, 4]$, where the tangent is parallel to X-axis.

Sol. We have, $y = x(x - 4)$, $x \in [0, 4]$

(i) y is a continuous function since $x(x - 4)$ is a polynomial function.

Hence, $y = x(x - 4)$ is continuous in $[0, 4]$.

(ii) $y' = (x - 4) \cdot 1 + x \cdot 1 = 2x - 4$ which exists in $(0, 4)$.

Hence, y is differentiable in $(0, 4)$.

(iii) $y(0) = 0(0 - 4) = 0$

and

$$y(4) = 4(4 - 4) = 0$$

$$\Rightarrow y(0) = y(4)$$

Sicne, conditions of Rolle's theorem are satisfied.

Hence, there exists a point c such that

$$f'(c) = 0 \text{ in } (0, 4)$$

$$[\because f'(x) = y']$$

$$\Rightarrow 2c - 4 = 0$$

$$\Rightarrow c = 2$$

$$\Rightarrow x = 2; y = 2(2 - 4) = -4$$

Thus, $(2, -4)$ is the point on the curve at which the tangent drawn is parallel to X-axis.

Verify mean value theorem for each of the functions.

Q. 73 $f(x) = \frac{1}{4x-1}$ in $[1, 4]$

💡 Thinking Process

We know that, mean value theorem states that, if f be a real function such that

- (i) $f(x)$ is continuous on $[a,b]$
- (ii) $f(x)$ is differentiable on $]a,b[$

Then, there exists a real number $c \in]a,b[$ such that $f'(c) = \frac{f(b) - f(a)}{b - a}$, thus we can verify it for given function.

Sol. We have, $f(x) = \frac{1}{4x-1}$ in $[1, 4]$

- (i) $f(x)$ is continuous in $[1, 4]$.

Also, at $x = \frac{1}{4}$, $f(x)$ is discontinuous.

Hence, $f(x)$ is continuous in $[1, 4]$.

- (ii) $f'(x) = -\frac{4}{(4x-1)^2}$, which exists in $(1, 4)$.

Since, conditions of mean value theorem are satisfied.

Hence, there exists a real number $c \in]1, 4[$ such that

$$\begin{aligned} f'(c) &= \frac{f(4) - f(1)}{4 - 1} \\ \Rightarrow \frac{-4}{(4c-1)^2} &= \frac{\frac{1}{16-1} - \frac{1}{4-1}}{4-1} = \frac{\frac{1}{15} - \frac{1}{3}}{3} \\ \Rightarrow \frac{-4}{(4c-1)^2} &= \frac{1-5}{45} = \frac{-4}{45} \\ \Rightarrow (4c-1)^2 &= 45 \\ \Rightarrow 4c-1 &= \pm 3\sqrt{5} \\ \Rightarrow c &= \frac{3\sqrt{5} + 1}{4} \in (1, 4) \quad [\text{neglecting } (-\text{ve}) \text{ value}] \end{aligned}$$

Hence, mean value theorem has been verified.

Q. 74 $f(x) = x^3 - 2x^2 - x + 3$ in $[0, 1]$

Sol. We have, $f(x) = x^3 - 2x^2 - x + 3$ in $[0, 1]$

- (i) Since, $f(x)$ is a polynomial function.

Hence, $f(x)$ is continuous in $[0, 1]$.

- (ii) $f'(x) = 3x^2 - 4x - 1$, which exists in $(0, 1)$.

Hence, $f(x)$ is differentiable in $(0, 1)$.

Since, conditions of mean value theorem are satisfied.

Therefore, by mean value theorem $\exists c \in (0, 1)$, such that

$$f'(c) = \frac{f(1) - f(0)}{1 - 0}$$

$$\begin{aligned}
&\Rightarrow 3c^2 - 4c - 1 = \frac{[1 - 2 - 1 + 3] - [0 + 3]}{1 - 0} \\
&\Rightarrow 3c^2 - 4c - 1 = \frac{-2}{1} \\
&\Rightarrow 3c^2 - 4c + 1 = 0 \\
&\Rightarrow 3c^2 - 3c - c + 1 = 0 \\
&\Rightarrow 3c(c - 1) - 1(c - 1) = 0 \\
&\Rightarrow (3c - 1)(c - 1) = 0 \\
&\Rightarrow c = 1/3, 1, \text{ where } \frac{1}{3} \in (0, 1)
\end{aligned}$$

Hence, the mean value theorem has been verified.

Q. 75 $f(x) = \sin x - \sin 2x$ in $[0, \pi]$

Sol. We have, $f(x) = \sin x - \sin 2x$ in $[0, \pi]$

- (i) Since, we know that sine functions are continuous functions hence $f(x) = \sin x - \sin 2x$ is a continuous function in $[0, \pi]$.
- (ii) $f(x) = \cos x - \cos 2x \cdot 2 = \cos x - 2 \cos 2x$, which exists in $(0, \pi)$.

So, $f(x)$ is differentiable in $(0, \pi)$. Conditions of mean value theorem are satisfied.

$$\begin{aligned}
&\text{Hence, } \exists c \in (0, \pi) \text{ such that, } f'(c) = \frac{f(\pi) - f(0)}{\pi - 0} \\
&\Rightarrow \cos c - 2\cos 2c = \frac{\sin \pi - \sin 2\pi - \sin 0 + \sin 2 \cdot 0}{\pi - 0} \\
&\Rightarrow 2\cos 2c - \cos c = \frac{0}{\pi} \\
&\Rightarrow 2 \cdot (2\cos^2 c - 1) - \cos c = 0 \\
&\Rightarrow 4\cos^2 c - 2 - \cos c = 0 \\
&\Rightarrow 4\cos^2 c - \cos c - 2 = 0 \\
&\Rightarrow \cos c = \frac{1 \pm \sqrt{1 + 32}}{8} = \frac{1 \pm \sqrt{33}}{8} \\
&\therefore c = \cos^{-1} \left(\frac{1 \pm \sqrt{33}}{8} \right)
\end{aligned}$$

$$\text{Also, } \cos^{-1} \left(\frac{1 \pm \sqrt{33}}{8} \right) \in (0, \pi)$$

Hence, mean value theorem has been verified.

Q. 76 $f(x) = \sqrt{25 - x^2}$ in $[1, 5]$

Sol. We have, $f(x) = \sqrt{25 - x^2}$ in $[1, 5]$

- (i) Since, $f(x) = (25 - x^2)^{1/2}$, where $25 - x^2 \geq 0$

$$\Rightarrow x^2 \leq 25 \Rightarrow -5 \leq x \leq 5$$

Hence, $f(x)$ is continuous in $[1, 5]$.

- (ii) $f'(x) = \frac{1}{2} (25 - x^2)^{-1/2} \cdot -2x = \frac{-x}{\sqrt{25 - x^2}}$, which exists in $(1, 5)$.

Hence, $f'(x)$ is differentiable in $(1, 5)$.

Since, conditions of mean value theorem are satisfied.

By mean value theorem $\exists c \in (1, 5)$ such that

$$\begin{aligned} f'(c) &= \frac{f(5) - f(1)}{5 - 1} \Rightarrow \frac{-c}{\sqrt{25 - c^2}} = \frac{0 - \sqrt{24}}{4} \\ \Rightarrow \frac{c^2}{25 - c^2} &= \frac{24}{16} \\ \Rightarrow 16c^2 &= 600 - 24c^2 \\ \Rightarrow c^2 &= \frac{600}{40} = 15 \\ \therefore c &= \pm \sqrt{15} \\ \text{Also, } c &= \sqrt{15} \in (1, 5) \end{aligned}$$

Hence, the mean value theorem has been verified.

Q. 77 Find a point on the curve $y = (x - 3)^2$, where the tangent is parallel to the chord joining the points $(3, 0)$ and $(4, 1)$.

Thinking Process

We know that, if $y = f(x)$ be a function defined on $[a, b]$ which follows mean value theorem, then there exists atleast one point c in (a, b) such that the tangent at the point $[c, f(c)]$ is parallel to the secant joining the points $[a, f(a)]$ and $[b, f(b)]$. So, we shall use this concept.

Sol. We have, $y = (x - 3)^2$, which is continuous in $x_1 = 3$ and $x_2 = 4$ i.e., $[3, 4]$.

Also, $y' = 2(x - 3) \cdot 1 = 2(x - 3)$ which exists in $(3, 4)$.

Hence, by mean value theorem there exists a point on the curve at which tangent drawn is parallel to the chord joining the points $(3, 0)$ and $(4, 1)$.

$$\begin{aligned} \text{Thus, } f'(c) &= \frac{f(4) - f(3)}{4 - 3} \\ \Rightarrow 2(c - 3) &= \frac{(4 - 3)^2 - (3 - 3)^2}{4 - 3} \\ \Rightarrow 2c - 6 &= \frac{1 - 0}{1} \Rightarrow c = \frac{7}{2} \end{aligned}$$

$$\text{For } x = \frac{7}{2}, \quad y = \left(\frac{7}{2} - 3\right)^2 = \left(\frac{1}{2}\right)^2 = \frac{1}{4}$$

So, $\left(\frac{7}{2}, \frac{1}{4}\right)$ is the point on the curve at which tangent drawn is parallel to the chord joining the points $(3, 0)$ and $(4, 1)$.

Q. 78 Using mean value theorem, prove that there is a point on the curve $y = 2x^2 - 5x + 3$ between the points $A(1, 0)$ and $B(2, 1)$, where tangent is parallel to the chord AB . Also, find that point.

Sol. We have, $y = 2x^2 - 5x + 3$, which is continuous in $[1, 2]$ as it is a polynomial function.

Also, $y' = 4x - 5$, which exists in $(1, 2)$.

By mean value theorem, $\exists c \in (1, 2)$ at which drawn tangent is parallel to the chord AB , where A and B are $(1, 0)$ and $(2, 1)$, respectively.

$$\therefore f'(c) = \frac{f(2) - f(1)}{2 - 1}$$

$$\Rightarrow 4c - 5 = \frac{(8 - 10 + 3) - (2 - 5 + 3)}{1}$$

$$\Rightarrow 4c - 5 = 1$$

$$\therefore c = \frac{6}{4} = \frac{3}{2} \in (1, 2)$$

For $x = \frac{3}{2}$,

$$y = 2\left(\frac{3}{2}\right)^2 - 5\left(\frac{3}{2}\right) + 3$$

$$= 2 \times \frac{9}{4} - \frac{15}{2} + 3 = \frac{9 - 15 + 6}{2} = 0$$

Hence, $\left(\frac{3}{2}, 0\right)$ is the point on the curve $y = 2x^2 - 5x + 3$ between the points $A (1, 0)$ and $B (2, 1)$, where tangent is parallel to the chord AB .

Long Answer Type Questions

Q. 79 Find the values of p and q , so that $f(x) = \begin{cases} x^2 + 3x + p, & \text{if } x \leq 1 \\ qx + 2, & \text{if } x > 1 \end{cases}$ is differentiable at $x = 1$.

Sol. We have, $f(x) = \begin{cases} x^2 + 3x + p, & \text{if } x \leq 1 \\ qx + 2, & \text{if } x > 1 \end{cases}$ is differentiable at $x = 1$.

$$\begin{aligned} Lf'(1) &= \lim_{x \rightarrow 1^-} \frac{f(x) - f(1)}{x - 1} \\ &= \lim_{x \rightarrow 1^-} \frac{(x^2 + 3x + p) - (1 + 3 + p)}{x - 1} \\ &= \lim_{h \rightarrow 0} \frac{[(1-h)^2 + 3(1-h) + p] - [1 + 3 + p]}{(1-h) - 1} \\ &= \lim_{h \rightarrow 0} \frac{[1+h^2 - 2h + 3 - 3h + p] - [4 + p]}{-h} \\ &= \lim_{h \rightarrow 0} \frac{[h^2 - 5h + p + 4 - 4 - p]}{-h} = \lim_{h \rightarrow 0} \frac{h[h-5]}{-h} \\ &= \lim_{h \rightarrow 0} -[h-5] = 5 \\ Rf'(1) &= \lim_{x \rightarrow 1^+} \frac{f(x) - f(1)}{x - 1} = \lim_{x \rightarrow 1^+} \frac{(qx + 2) - (1 + 3 + p)}{x - 1} \\ &= \lim_{h \rightarrow 0} \frac{[q(1+h) + 2] - (4 + p)}{1 + h - 1} \\ &= \lim_{h \rightarrow 0} \frac{[q + qh + 2 - 4 - p]}{h} = \lim_{h \rightarrow 0} \frac{qh + (q-2-p)}{h} \end{aligned}$$

$$\Rightarrow q - 2 - p = 0 \Rightarrow p - q = -2 \quad \dots(i)$$

$$\Rightarrow \lim_{h \rightarrow 0} \frac{qh + 0}{h} = q$$

[for existing the limit]

If $Lf'(1) = Rf'(1)$, then $5 = q$

$$\begin{aligned} \Rightarrow p - 5 &= -2 \Rightarrow p = 3 \\ \therefore p &= 3 \text{ and } q = 5 \end{aligned}$$

Q. 80 If $x^m \cdot y^n = (x + y)^{m+n}$, prove that

$$(i) \frac{dy}{dx} = \frac{y}{x} \text{ and} \quad (ii) \frac{d^2y}{dx^2} = 0$$

Sol. We have,

$$x^m \cdot y^n = (x + y)^{m+n} \quad \dots(i)$$

(i) Differentiating Eq. (i) w.r.t. x , we get

$$\begin{aligned} & \frac{d}{dx}(x^m \cdot y^n) = \frac{d}{dx}(x + y)^{m+n} \\ \Rightarrow & x^m \cdot \frac{d}{dy} y^n \cdot \frac{dy}{dx} + y^n \cdot \frac{d}{dx} x^m = (m+n)(x+y)^{m+n-1} \frac{d}{dx}(x+y) \\ \Rightarrow & x^m \cdot ny^{n-1} \frac{dy}{dx} + y^n \cdot mx^{m-1} = (m+n)(x+y)^{m+n-1} \left(1 + \frac{dy}{dx}\right) \\ \Rightarrow & \frac{dy}{dx} [x^m \cdot ny^{n-1} - (m+n) \cdot (x+y)^{m+n-1}] = (m+n)(x+y)^{m+n-1} - y^n mx^{m-1} \\ \Rightarrow & \frac{dy}{dx} [nx^m y^{n-1} - (m+n)(x+y)^{m+n-1}] = (m+n) \cdot (x+y)^{m+n-1} - \frac{y^{n-1} \cdot y \cdot mx^m}{x} \\ \therefore & \frac{dy}{dx} = \frac{\frac{(m+n)(x+y)^{m+n}}{(x+y)} - \frac{y^{n-1} \cdot y \cdot mx^m}{x}}{\frac{n x^m y^n}{y} - (m+n)(x+y)^{m+n-1} \frac{1}{(x+y)}} \\ & = \frac{\frac{x(m+n)(x+y)^{m+n}}{(x+y) \cdot x} - \frac{(x+y) \cdot y^{n-1} y \cdot mx^m}{(x+y) \cdot y}}{\frac{(x+y) n x^m y^n - y(m+n)(x+y)^{m+n}}{(x+y) \cdot y}} \\ & = \frac{\frac{x(m+n) \cdot x^m \cdot y^n - m(x+y) y^n x^m}{(x+y) \cdot x}}{\frac{(x+y) n x^m y^n - y(m+n) \cdot x^m \cdot y^n}{(x+y) \cdot y}} \quad [\because (x+y)^{m+n} = x^m \cdot y^n] \\ & = \frac{x^m y^n [mx + nx - mx - my] \cdot (x+y) y}{x^m y^n [nx + ny - my - ny] \cdot (x+y) \cdot x} \\ & = \frac{y}{x} \quad \dots(ii) \end{aligned}$$

Hence proved.

(ii) Further, differentiating Eq. (ii) i.e., $\frac{dy}{dx} = \frac{y}{x}$ on both the sides w.r.t. x , we get

$$\begin{aligned} \frac{d^2y}{dx^2} &= \frac{x \cdot \frac{dy}{dx} - y \cdot 1}{x^2} \\ &= \frac{x \cdot \frac{y}{x} - y}{x^2} \\ &= 0 \quad \left[\because \frac{dy}{dx} = \frac{y}{x}\right] \end{aligned}$$

Hence proved.

Q. 81 If $x = \sin t$ and $y = \sin pt$, then prove that

$$(1 - x^2) \frac{d^2y}{dx^2} - x \frac{dy}{dx} + p^2 y = 0.$$

Sol. We have, $x = \sin t$ and $y = \sin pt$

$$\begin{aligned} \therefore \quad & \frac{dx}{dt} = \cos t \text{ and } \frac{dy}{dt} = \cos pt \cdot p \\ \Rightarrow \quad & \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{p \cdot \cos pt}{\cos t} \end{aligned} \quad \dots(i)$$

Again, differentiating both sides w.r.t. x , we get

$$\begin{aligned} \frac{d^2y}{dx^2} &= \frac{\cos t \cdot \frac{d}{dt}(p \cdot \cos pt) \frac{dt}{dx} - p \cos pt \cdot \frac{d}{dt} \cos t \cdot \frac{dt}{dx}}{\cos^2 t} \\ &= \frac{[\cos t \cdot p \cdot (-\sin pt) \cdot p - p \cos pt \cdot (-\sin t)] \frac{dt}{dx}}{\cos^2 t} \\ &= \frac{[-p^2 \sin pt \cdot \cos t + p \sin t \cdot \cos pt] \cdot \frac{1}{\cos t}}{\cos^2 t} \\ \Rightarrow \quad & \frac{d^2y}{dx^2} = \frac{-p^2 \sin pt \cdot \cos t + p \cos pt \cdot \sin t}{\cos^3 t} \end{aligned} \quad \dots(ii)$$

Since, we have to prove

$$\begin{aligned} (1 - x^2) \frac{d^2y}{dx^2} - x \frac{dy}{dx} + p^2 y &= 0 \\ \therefore \quad \text{LHS} &= (1 - \sin^2 t) \frac{[-p^2 \sin pt \cdot \cos t + p \cos pt \cdot \sin t]}{\cos^3 t} \\ &\quad - \sin t \cdot \frac{p \cos pt}{\cos t} + p^2 \sin pt \\ &= \frac{1}{\cos^3 t} \left[(1 - \sin^2 t)(-p^2 \sin pt \cdot \cos t + p \cos pt \cdot \sin t) \right] \\ &\quad - p \cos pt \cdot \sin t \cdot \cos^2 t + p^2 \sin pt \cdot \cos^3 t \\ &= \frac{1}{\cos^3 t} \left[-p^2 \sin pt \cdot \cos^3 t + p \cos pt \cdot \sin t \cdot \cos^2 t \right] [\because 1 - \sin^2 t = \cos^2 t] \\ &= \frac{1}{\cos^3 t} \cdot 0 \\ &= 0 \end{aligned}$$

Hence proved.

Q. 82 Find the value of $\frac{dy}{dx}$, if $y = x^{\tan x} + \sqrt{\frac{x^2 + 1}{2}}$.

Sol. We have,

$$y = x^{\tan x} + \sqrt{\frac{x^2 + 1}{2}} \quad \dots(i)$$

$$\text{Taking } u = x^{\tan x} \text{ and } v = \sqrt{\frac{x^2 + 1}{2}}, \quad \dots(ii)$$

$$\log u = \tan x \log x \quad \dots(ii)$$

$$\text{and } v^2 = \frac{x^2 + 1}{2} \quad \dots(iii)$$

On, differentiating Eq. (ii) w.r.t. x , we get

$$\begin{aligned} \frac{1}{u} \cdot \frac{du}{dx} &= \tan x \cdot \frac{1}{x} + \log x \cdot \sec^2 x \\ \Rightarrow \quad \frac{du}{dx} &= u \left[\frac{\tan x}{x} + \log x \cdot \sec^2 x \right] \\ &= x^{\tan x} \left[\frac{\tan x}{x} + \log x \cdot \sec^2 x \right] \end{aligned} \quad \dots(iv)$$

Also, differentiating Eq. (iii) w.r.t. x , we get

$$\begin{aligned} 2v \cdot \frac{dv}{dx} &= \frac{1}{2} (2x) \Rightarrow \frac{dv}{dx} = \frac{1}{4v} \cdot (2x) \\ \Rightarrow \quad \frac{dv}{dx} &= \frac{1}{4 \cdot \sqrt{\frac{x^2+1}{2}}} \cdot 2x = \frac{x \cdot \sqrt{2}}{2\sqrt{x^2+1}} \\ \Rightarrow \quad \frac{dv}{dx} &= \frac{x}{\sqrt{2(x^2+1)}} \end{aligned} \quad \dots(v)$$

Now,

$$\begin{aligned} y &= u + v \\ \therefore \quad \frac{dy}{dx} &= \frac{du}{dx} + \frac{dv}{dx} \\ &= x^{\tan x} \left[\frac{\tan x}{x} + \log x \cdot \sec^2 x \right] + \frac{x}{\sqrt{2(x^2+1)}} \end{aligned}$$

Objective Type Questions

Q. 83 If $f(x) = 2x$ and $g(x) = \frac{x^2}{2} + 1$, then which of the following can be a discontinuous function?

- | | |
|-----------------------|-------------------------|
| (a) $f(x) + g(x)$ | (b) $f(x) - g(x)$ |
| (c) $f(x) \cdot g(x)$ | (d) $\frac{g(x)}{f(x)}$ |

Sol. (d) We know that, if f and g be continuous functions, then

- | | |
|---------------------------|--|
| (a) $f + g$ is continuous | (b) $f - g$ is continuous. |
| (c) fg is continuous | (d) $\frac{f}{g}$ is continuous at these points, where $g(x) \neq 0$. |

Here,

$$\frac{g(x)}{f(x)} = \frac{\frac{x^2}{2} + 1}{2x} = \frac{x^2 + 2}{4x}$$

which is discontinuous at $x = 0$.

Q. 84 The function $f(x) = \frac{4-x^2}{4x-x^3}$ is

- (a) discontinuous at only one point
- (b) discontinuous at exactly two points
- (c) discontinuous at exactly three points
- (d) None of the above

Sol. (c) We have,

$$\begin{aligned} f(x) &= \frac{4-x^2}{4x-x^3} = \frac{(4-x^2)}{x(4-x^2)} \\ &= \frac{(4-x^2)}{x(2^2-x^2)} = \frac{4-x^2}{x(2+x)(2-x)} \end{aligned}$$

Clearly, $f(x)$ is discontinuous at exactly three points $x = 0$, $x = -2$ and $x = 2$.

Q. 85 The set of points where the function f given by $f(x) = |2x-1| \sin x$ is differentiable is

- (a) R
- (b) $R - \left(\frac{1}{2}\right)$
- (c) $(0, \infty)$
- (d) None of these

Sol. (b) We have, $f(x) = |2x-1| \sin x$

At $x = \frac{1}{2}$, $f(x)$ is not differentiable.

Hence, $f(x)$ is differentiable in $R - \left(\frac{1}{2}\right)$.

$$\begin{aligned} Rf\left(\frac{1}{2}\right) &= \lim_{h \rightarrow 0} \frac{f\left(\frac{1}{2} + h\right) - f\left(\frac{1}{2}\right)}{h} \\ &= \lim_{h \rightarrow 0} \frac{\left|2\left(\frac{1}{2} + h\right) - 1\right| \sin\left(\frac{1}{2} + h\right) - 0}{h} \\ &= \lim_{h \rightarrow 0} \frac{|2h| \cdot \sin\left(\frac{1+2h}{2}\right)}{h} = 2 \cdot \sin\frac{1}{2} \end{aligned}$$

and

$$\begin{aligned} Lf\left(\frac{1}{2}\right) &= \lim_{h \rightarrow 0} \frac{f\left(\frac{1}{2} - h\right) - f\left(\frac{1}{2}\right)}{-h} \\ &= \lim_{h \rightarrow 0} \frac{\left|2\left(\frac{1}{2} - h\right)\right|^{-1} \sin\left(\frac{1}{2} - h\right) - 0}{-h} \\ &= \lim_{h \rightarrow 0} \frac{|0-2h| \sin\left(\frac{1}{2} - h\right)}{-h} = -2 \sin\left(\frac{1}{2}\right) \end{aligned}$$

$$\therefore Rf\left(\frac{1}{2}\right) \neq Lf\left(\frac{1}{2}\right)$$

So, $f(x)$ is not differentiable at $x = \frac{1}{2}$.

Q. 86 The function $f(x) = \cot x$ is discontinuous on the set

- | | |
|---|--|
| (a) $\{x = n\pi : n \in \mathbb{Z}\}$ | (b) $\{x = 2n\pi : n \in \mathbb{Z}\}$ |
| (c) $\left\{ x = (2n+1)\frac{\pi}{2} : n \in \mathbb{Z} \right\}$ | (d) $\left\{ x = \frac{n\pi}{2} : n \in \mathbb{Z} \right\}$ |

Sol. (a) We know that, $f(x) = \cot x$ is continuous in $R - \{n\pi : n \in \mathbb{Z}\}$.

$$\text{Since, } f(x) = \cot x = \frac{\cos x}{\sin x} \quad [\text{since, } \sin x = 0 \text{ at } n\pi, n \in \mathbb{Z}]$$

Hence, $f(x) = \cot x$ is discontinuous on the set $\{x = n\pi : n \in \mathbb{Z}\}$.

Q. 87 The function $f(x) = e^{|x|}$ is

- (a) continuous everywhere but not differentiable at $x = 0$
- (b) continuous and differentiable everywhere
- (c) not continuous at $x = 0$
- (d) None of the above

Sol. (a) Let $u(x) = |x|$ and $v(x) = e^x$

$$\begin{aligned} \therefore f(x) &= v \circ u(x) = v[u(x)] \\ &= v|x| = e^{|x|} \end{aligned}$$

Since, $u(x)$ and $v(x)$ are both continuous functions.

So, $f(x)$ is also continuous function but $u(x) = |x|$ is not differentiable at $x = 0$, whereas $v(x) = e^x$ is differentiable at everywhere.

Hence, $f(x)$ is continuous everywhere but not differentiable at $x = 0$.

Q. 88 If $f(x) = x^2 \sin \frac{1}{x}$, where $x \neq 0$, then the value of the function f at

$x = 0$, so that the function is continuous at $x = 0$, is

- (a) 0
- (b) -1
- (c) 1
- (d) None of these

Sol. (a) $\because f(x) = x^2 \sin \left(\frac{1}{x} \right)$, where $x \neq 0$

Hence, value of the function f at $x = 0$, so that it is continuous at $x = 0$ is 0.

Q. 89 If $f(x) = \begin{cases} mx + 1, & \text{if } x \leq \frac{\pi}{2} \\ \sin x + n, & \text{if } x > \frac{\pi}{2} \end{cases}$ is continuous at $x = \frac{\pi}{2}$, then

- (a) $m = 1, n = 0$
- (b) $m = \frac{n\pi}{2} + 1$
- (c) $n = \frac{m\pi}{2}$
- (d) $m = n = \frac{\pi}{2}$

Sol. (c) We have, $f(x) = \begin{cases} mx + 1, & \text{if } x \leq \frac{\pi}{2} \\ (\sin x + n), & \text{if } x > \frac{\pi}{2} \end{cases}$ is continuous at $x = \frac{\pi}{2}$

$$\therefore \text{LHL} = \lim_{x \rightarrow \frac{\pi^-}{2}} (mx + 1) = \lim_{h \rightarrow 0} \left[m\left(\frac{\pi}{2} - h\right) + 1 \right] = \frac{m\pi}{2} + 1$$

$$\text{and } \text{RHL} = \lim_{x \rightarrow \frac{\pi^+}{2}} (\sin x + n) = \lim_{h \rightarrow 0} \left[\sin\left(\frac{\pi}{2} + h\right) + n \right] \\ = \lim_{h \rightarrow 0} \cosh + n = 1 + n$$

$$\therefore \text{LHL} = \text{RHL} \quad \left[\text{to be continuous at } x = \frac{\pi}{2} \right]$$

$$\Rightarrow m \cdot \frac{\pi}{2} + 1 = n + 1$$

$$\therefore n = m \cdot \frac{\pi}{2}$$

Q. 90 If $f(x) = |\sin x|$, then

- (a) f is everywhere differentiable
- (b) f is everywhere continuous but not differentiable at $x = n\pi, n \in \mathbb{Z}$
- (c) f is everywhere continuous but not differentiable at $x = (2n+1) \frac{\pi}{2}, n \in \mathbb{Z}$
- (d) None of the above

Sol. (b) We have, $f(x) = |\sin x|$

$$\text{Let } f(x) = v \circ u(x) = v[u(x)] \quad [\text{where, } u(x) = \sin x \text{ and } v(x) = |x|] \\ = v(\sin x) = |\sin x|$$

where, $u(x)$ and $v(x)$ are both continuous.

Hence, $f(x) = v \circ u(x)$ is also a continuous function but $v(x)$ is not differentiable at $x = 0$.

So, $f(x)$ is not differentiable where $\sin x = 0 \Rightarrow x = n\pi, n \in \mathbb{Z}$

Hence, $f(x)$ is continuous everywhere but not differentiable at $x = n\pi, n \in \mathbb{Z}$.

Q. 91 If $y = \log\left(\frac{1-x^2}{1+x^2}\right)$, then $\frac{dy}{dx}$ is equal to

- (a) $\frac{4x^3}{1-x^4}$ (b) $\frac{-4x}{1-x^4}$ (c) $\frac{1}{4-x^4}$ (d) $\frac{-4x^3}{1-x^4}$

Sol. (b) We have,

$$y = \log\left(\frac{1-x^2}{1+x^2}\right)$$

$$\therefore \frac{dy}{dx} = \frac{1}{1-x^2} \cdot \frac{d}{dx} \left(\frac{1-x^2}{1+x^2} \right) \\ = \frac{(1+x^2) \cdot (1+x^2) \cdot (-2x) - (1-x^2) \cdot 2x}{(1-x^2) \cdot (1+x^2)^2} \\ = \frac{-2x[1+x^2+1-x^2]}{(1-x^2) \cdot (1+x^2)} = \frac{-4x}{1-x^4}$$

Q. 92 If $y = \sqrt{\sin x + y}$, then $\frac{dy}{dx}$ is equal to

(a) $\frac{\cos x}{2y - 1}$

(b) $\frac{\cos x}{1 - 2y}$

(c) $\frac{\sin x}{1 - 2y}$

(d) $\frac{\sin x}{2y - 1}$

Sol. (a) $\because y = (\sin x + y)^{1/2}$

$$\begin{aligned} \therefore \frac{dy}{dx} &= \frac{1}{2} (\sin x + y)^{-1/2} \cdot \frac{d}{dx} (\sin x + y) \\ \Rightarrow \frac{dy}{dx} &= \frac{1}{2} \cdot \frac{1}{(\sin x + y)^{1/2}} \cdot \left(\cos x + \frac{dy}{dx} \right) \\ \Rightarrow \frac{dy}{dx} &= \frac{1}{2y} \left(\cos x + \frac{dy}{dx} \right) & [\because (\sin x + y)^{1/2} = y] \\ \Rightarrow \frac{dy}{dx} \left(1 - \frac{1}{2y} \right) &= \frac{\cos x}{2y} \\ \therefore \frac{dy}{dx} &= \frac{\cos x}{2y} \cdot \frac{2y}{2y - 1} = \frac{\cos x}{2y - 1} \end{aligned}$$

Q. 93 The derivative of $\cos^{-1}(2x^2 - 1)$ w.r.t. $\cos^{-1}x$ is

(a) 2

(b) $\frac{-1}{2\sqrt{1-x^2}}$

(b) $\frac{2}{x}$

(d) $1 - x^2$

Sol. (a) Let $u = \cos^{-1}(2x^2 - 1)$ and $v = \cos^{-1}x$

$$\begin{aligned} \therefore \frac{dv}{dx} &= \frac{+1}{\sqrt{1-(2x^2-1)^2}} \cdot 4x = \frac{-4x}{\sqrt{1-(4x^4+1-4x^2)}} \\ &= \frac{-4x}{\sqrt{-4x^4+4x^2}} = \frac{-4x}{\sqrt{4x^2(1-x^2)}} \\ &= \frac{-2}{\sqrt{1-x^2}} \end{aligned}$$

and

$$\frac{du}{dx} = \frac{-1}{\sqrt{1-x^2}}$$

$$\therefore \frac{dx}{dv} = \frac{du/dx}{dv/dx} = \frac{-2/\sqrt{1-x^2}}{-1/\sqrt{1-x^2}} = 2$$

Q. 94 If $x = t^2$ and $y = t^3$, then $\frac{d^2y}{dx^2}$ is equal to

(a) $\frac{3}{2}$

(b) $\frac{3}{4t}$

(c) $\frac{3}{2t}$

(d) $\frac{3}{2t}$

Sol. (b) We have, $x = t^2$ and $y = t^3$

$$\therefore \frac{dx}{dt} = 2t \text{ and } \frac{dy}{dt} = 3t^2$$

$$\therefore \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{3t^2}{2t} = \frac{3}{2}t$$

On further differentiating w.r.t. x , we get

$$\begin{aligned}\frac{d^2y}{dx^2} &= \frac{3}{2} \cdot \frac{d}{dt} t \cdot \frac{dt}{dx} \\ &= \frac{3}{2} \cdot \frac{1}{2t} \\ &= \frac{3}{4t}\end{aligned}\quad \left[\because \frac{dt}{dx} = \frac{1}{2t} \right]$$

Q. 95 The value of c in Rolle's theorem for the function $f(x) = x^3 - 3x$ in the interval $[0, \sqrt{3}]$ is

- | | | | |
|-------|--------|-------------------|-------------------|
| (a) 1 | (b) -1 | (c) $\frac{3}{2}$ | (d) $\frac{1}{3}$ |
|-------|--------|-------------------|-------------------|

Sol. (a) $\because f(c) = 0$ $[\because f(x) = 3x^2 - 3]$
 $\Rightarrow 3c^2 - 3 = 0$
 $\Rightarrow c^2 = \frac{3}{3} = 1$
 $\Rightarrow c = \pm 1, \text{ where } 1 \in (0, \sqrt{3})$
 $\therefore c = 1$

Q. 96 For the function $f(x) = x + \frac{1}{x}$, $x \in [1, 3]$, the value of c for mean value theorem is

- | | |
|-------|-------------------|
| (a) 1 | (b) $\sqrt{3}$ |
| (c) 2 | (d) None of these |

Sol. (b) $\because f'(c) = \frac{f(b) - f(a)}{b - a}$
 $\Rightarrow 1 - \frac{1}{c^2} = \frac{\left[3 + \frac{1}{3}\right] - \left[1 + \frac{1}{1}\right]}{3 - 1}$ $\left[\because f'(x) = 1 - \frac{1}{x^2} \right]$
and $b = 3, a = 1$
 $\Rightarrow \frac{c^2 - 1}{c^2} = \frac{\frac{10}{3} - 2}{2}$
 $\Rightarrow \frac{c^2 - 1}{c^2} = \frac{4}{3 \times 2} = \frac{2}{3}$
 $\Rightarrow 3(c^2 - 1) = 2c^2$
 $\Rightarrow 3c^2 - 2c^2 = 3$
 $\Rightarrow c^2 = 3 \Rightarrow c = \pm \sqrt{3}$
 $\therefore c = \sqrt{3} \in (1, 3)$

Fillers

Q. 97 An example of a function which is continuous everywhere but fails to be differentiable exactly at two points is

Sol. $|x| + |x - 1|$ is continuous everywhere but fails to be differentiable exactly at two points $x = 0$ and $x = 1$.

So, there can be more such examples of functions.

Q. 98 Derivative of x^2 w.r.t. x^3 is

Sol. Derivative of x^2 w.r.t. x^3 is $\frac{2}{3x}$.

Let

$$u = x^2 \text{ and } v = x^3$$

\therefore

$$\frac{du}{dx} = 2x \text{ and } \frac{dv}{dx} = 3x^2$$

\Rightarrow

$$\frac{du}{dv} = \frac{2x}{3x^2} = \frac{2}{3x}$$

Q. 99 If $f(x) = |\cos x|$, then $f' \left(\frac{\pi}{4} \right)$ is equal to

Sol. If $f(x) = |\cos x|$, then $f' \left(\frac{\pi}{4} \right)$

\because

$$0 < x < \frac{\pi}{2}, \cos x > 0.$$

\therefore

$$f(x) = +\cos x$$

\Rightarrow

$$f'(x) = (-\sin x)$$

$$f' \left(\frac{\pi}{4} \right) = -\sin \frac{\pi}{4} = \frac{-1}{\sqrt{2}}$$

$$\left[\because \sin \frac{\pi}{4} = \frac{1}{\sqrt{2}} \right]$$

Q. 100 If $f(x) = |\cos x - \sin x|$, then $f' \left(\frac{\pi}{3} \right)$ is equal to

Sol. \because

$$f(x) = |\cos x - \sin x|,$$

\therefore

$$f' \left(\frac{\pi}{3} \right) = \frac{\sqrt{3} + 1}{2}$$

We know that, $\frac{\pi}{4} < x < \frac{\pi}{2}$, $\sin x > \cos x$

$\therefore \cos x - \sin x \leq 0$ i.e.,

$$f(x) = -(\cos x - \sin x)$$

$$f'(x) = -[-\sin x - \cos x]$$

\therefore

$$f' \left(\frac{\pi}{3} \right) = -\left(\frac{-\sqrt{3}}{2} - \frac{1}{2} \right) = \left(\frac{\sqrt{3} + 1}{2} \right)$$

Q. 101 For the curve $\sqrt{x} + \sqrt{y} = 1$, $\frac{dy}{dx}$ at $\left(\frac{1}{4}, \frac{1}{4}\right)$ is

Sol. For the curve $\sqrt{x} + \sqrt{y} = 1$, $\frac{dy}{dx}$ at $\left(\frac{1}{4}, \frac{1}{4}\right)$ is -1 .

We have,
$$\sqrt{x} + \sqrt{y} = 1$$

$$\Rightarrow \frac{1}{2\sqrt{x}} + \frac{1}{2\sqrt{y}} \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = -\frac{\sqrt{y}}{\sqrt{x}}$$

$$\therefore \left(\frac{dy}{dx}\right)_{\left(\frac{1}{4}, \frac{1}{4}\right)} = -\frac{\frac{1}{2}}{\frac{1}{2}} = -1$$

True/False

Q. 102 Rolle's theorem is applicable for the function $f(x) = |x - 1|$ in $[0, 2]$.

Sol. *False*

Hence, $f(x) = |x - 1|$ in $[0, 2]$ is not differentiable at $x = 1 \in (0, 2)$.

Q. 103 If f is continuous on its domain D , then $|f|$ is also continuous on D .

Sol. *True*

Q. 104 The composition of two continuous function is a continuous function.

Sol. *True*

Q. 105 Trigonometric and inverse trigonometric functions are differentiable in their respective domain.

Sol. *True*

Q. 106 If $f \cdot g$ is continuous at $x = a$, then f and g are separately continuous at $x = a$.

Sol. *False*

Let $f(x) = \sin x$ and $g(x) = \cot x$

$$\therefore f(x) \cdot g(x) = \sin x \cdot \frac{\cos x}{\sin x} = \cos x$$

which is continuous at $x = 0$ but $\cot x$ is not continuous at $x = 0$.
